## Slotted round head screw BSW

NEN ≈1779 A (1960)  
 BS ≈450 (1958)

### Technical data

| d    | Threads per inch | dk   | k   | n   |
|------|------------------|------|-----|-----|
| 1/8  | 40               | 5,5  | 2,1 | 0,8 |
| 5/32 | 32               | 7    | 2,7 | 0,9 |
| 3/16 | 24               | 8,3  | 3,2 | 1,1 |
| 1/4  | 20               | 11   | 4,3 | 1,3 |
| 5/16 | 18               | 13,5 | 5,4 | 1,5 |
| 3/8  | 16               | 16,5 | 6,5 | 1,8 |

- Whitworth thread (BSW) is not internationally recommended.
- It is advised to use metric (M).
- Lengths over 2 inch are partly threaded, min. threadlength is 1.3/4 inch.

## TAPTITE 2000® Thread-rolling bolts and screws

### General

Due to their specific triangular (trilobular) cross section and flowing transitions, TAPTITE thread-rolling bolts and screws form the internal screw thread in the side of a predrilled or punched hole without creating swarf; tapping is dispensed with and no annoying and sometimes unallowable swarf is created.

**TAPTITE 2000®** bolts and screws now, in addition to the proven advantages of their standard predecessor, have an innovative thread design: the Radius Profile™. This results in a new generation of fasteners with excellent mechanical, assembly and ergonomic characteristics; as yet unsurpassed by any other technology.

### Applications

**TAPTITE 2000®** thread-rolling bolts and screws can be used in all ductile metals up to 500 N/mm<sup>2</sup> or 150 HB.

### Load

Due to the cold hardening of the material, the uninterrupted fibre structure and the full flank overlapping, the connection can accommodate considerably higher forces, usually a smaller size can be used than for a tapped thread; therefore a lighter design. Moreover, the special Radius Profile™ ensures a low insertion torque, while the preloading force and pull-out force have increased; thus a higher safety margin.

### Locking

Due to the clamping action of the material on the thread flanks, the connection is self-locking; no additional locking agents are required.

### Formed thread

The **TAPTITE 2000®** thread rolling bolts and screws form a normal ISO metric thread, into which other metric fasteners with the usual 6h tolerance (according to ISO 965) can be screwed.

### Drive, head style and point length

All usual drive options and head styles are possible. Serrations under the head, a colour, an attached washer or pre-coated adhesive or seals are also possible. The conical screw thread point length of this new generation of **TAPTITE 2000®** thread-rolling bolts and screws has been reduced to approximately 2 – 2.5 P (was at the maximum 4P).

### Material and surface coating

**TAPTITE 2000®** thread-rolling bolts and screws are made of case hardening steel and are case hardened (min. 450 HV0.3), while the core has retained its ductility (300-350 HV10). As standard, the bolts/screws are Cr<sup>6+</sup> free electro-galvanized. Other surface coatings or materials are possible.

6

### Design values for TAPTITE 2000® thread-rolling bolts and screws <sup>(1)</sup>

- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

## REMFORM® Thread-forming screws for use in plastics

### Specific characteristics of REMFORM® thread-forming screws for use in plastics

- The ideal solution for fastening of/ in all types of plastic (thermoplastic or elastomer)
- Angle of thread of just 8°
- Asymmetric thread geometry which allows the plastic during assembly to flow along the load-bearing flank resulting in
  - less plastic being displaced
  - lower insertion torque
  - deeper profile depth
  - large flank cover, therefore high loadability
  - less chance of the plastic cracking
  - useable in thin-walled castings
- Made as standard
  - in strength class 9.8
  - Cr<sup>6+</sup>-free electro-galvanized
  - other materials and surface coatings are possible
- Due to the clamping action of the material on the thread flanks, the connection is self-locking

## FABORY-SPEDEC Selfdrilling screws

### General

With the FABORY-SPEDEC fastening system of DIRECT ASSEMBLY the correct core hole is drilled, the thread is tapped, and the construction parts are connected reliably in one single operation. Thus no drilling or punching of the hole and no thread tapping.

### Material

The FABORY-SPEDEC self-drilling screws are made of case-hardened steel (min. 560 HV 0.3), with the core remains tough (270-425 HV 0.3). FABORY-SPEDEC self-drilling screws meet the sizes, requirements and tests acc. to DIN 7504.

### System

Every FABORY-SPEDEC self-drilling screw drills the hole with its own integrated self-drilling point. Thus quicker and lighter assembly and no time consuming alignment and positioning of construction parts.

### Recess

FABORY-SPEDEC self-drilling screws are provided with a PHILLIPS recess, hexalobular recess or SR recess, thus equipped for mechanized mass-assembly with electrical setting tools.

### Standards

FABORY-SPEDEC self-drilling screw head forms and dimensions are according to DIN standards of normal screws.

### Threads

FABORY-SPEDEC self-drilling screws with self-tapping threads (designation ST) according to DIN 7970. Full thread to achieve good clamping in the joint.

### Application

Stainless steel A2 FABORY-SPEDEC self-drilling screws are only to be used in aluminium alloys with a Brinell hardness up to 75 HB, aluminium self-drilling screws are only to be used in plastics and aluminium alloys.

Guide values for STEEL FABORY-SPEDEC self-drilling screws type SN

### Recess types

Screws have various types of recess, i.e.: slotted recess, Phillips-cross recess, Pozidriv-cross recess, hexalobular recess and **SR-recess**.

The first five types have one general disadvantage, dimensional deviation of the recess and tool result in excessive clearance between recess and tool, resulting in instability when starting the screw, (vibration and wobble). This excessive clearance can also be a problem when disassembling screws in a difficult location.

### SR-recess

The SR-recess has been developed to eliminate the problem of excessive clearance. The **SR-recess** is in principle a combination of a square-recess and cross-recess. The conical square-recess enables the SR-screw to be attached directly to the SR-tool. The screw, despite its own mass, remains firmly attached to the tool. The excellent connection ensures that wear between the recess and tool (bit) is kept to a minimum. The life expectancy of a SR-tool (bit) is **double** the life of a conventional tool.

| No. SR           | 1     | 2     | 2     | 2     |

- SR-recess is a cross recess/square recess combination. Assembly with the electric setting tool DI 320 and with SR screwdriver bits, see group codes 31535 and 31640.
- Max. grip length KL = L – L<sub>1</sub>.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

- A = Breaking load min. in N.
- B = Shear strength min. in N.
- C = Ultimate moment in Nm.
- D = Drillcap. in steel cross cross members (min.).
- E = Drillcap. in steel cross cross members (max.).
- F = Drillcap. in aluminium cross cross members (min.).
- G = Drillcap. in aluminium cross cross members (max.).
- Applicable for direct-assembly of plywood and particleboard liners on aluminium and steel cross members.
- Max. grip length KL = L – L<sub>1</sub>
- SR-recess is a cross recess/square recess combination. Assembly with the electric setting tool DI 320 and with SR screwdriver bits, see group code 31630 and 31640.
- Steel with pull-out force max. 540 N/mm<sup>2</sup>.

- A = Breaking load min. in N.
- B = Shear strength min. in N.
- C = Ultimate moment in Nm.
- D = Drillcap. in steel cross cross members St37 (min.).
- E = Drillcap. in steel cross cross members St37 (max.).
- F = Drillcap. in steel cross cross members St52 (min.).
- G = Drillcap. in steel cross cross members St52 (max.).
- Applicable for direct-assembly of soft wooden beams on steel cross members.
- Max. grip length KL = L – L<sub>1</sub>
- St52: With higher steelqualities the max. drilling thickness is reduced.

Special features of FABORY-SPEDEC self-drilling screws type **SCT**:

- the normal drilling point has been replaced by a drilling plate of special hardened steel. This type ensures, when the SC self-drilling screws cause problems, that the area of application can be extended considerably
- in one single operation: start of assembly, drilling through wood, drilling through steel, wings breaking off, forming thread, tightening screw, assembly finished (see assembly sequence)
- assembly with electric setting tool type type CF 250(P), see group codes 31570 (31572).

- A = Breaking load min. in N.
- B = Shear strength min. in N.
- C = Ultimate moment in Nm.
- D = Drillcap. in steel cross cross members St37 (min.).
- E = Drillcap. in steel cross cross members St37 (max.).
- Applicable for direct-assembly of soft wooden beams on steel cross members.
- Max. grip length KL = L – L<sub>1</sub>
- St37 With higher steelqualities the max. drilling thickness is reduced.

Special features of FABORY-SPEDEC self-drilling screws type **SC**:

- with **pressed** drilling point
- with **under head ribs** for countersinking in wood
- assembly with electric setting tool type type CF 250(P), see group codes 31570 (31572)

| COMPLETE TOOL | 1 <a href="#">31570.001.770</a> |

- Suitable for self-drilling screws type SC (with Torx® TX30) and type SCT (with Torx® TX30)
- Manufacturer screwdriver: Fein ASze 648 d
- Input 740 W
- Voltage 220 V/50 Hz
- Revolutions 0 - 1560 r.p.m. (loaded) and 1250-2600 r.p.m. (unloaded)
- Total length 1080 mm
- Weight 9,8 kg
- Right hand turning
- Adjustable depth-stop
- Upright working position
- Ergonomical
- Theoretical production 250 self-drilling screws by the hour!!

SR2                      1                      [31640.001.770](http://31640.001.770)

- With special connection for setting tool type DI 320
- Suitable for self-drilling screws with SR recess (cross recess/square recess combination)

## Chipboard Screws

### General

Chipboard screws, also called speedscrews or particle board screws, are specially developed to prevent the problems arising with the application of the conventional woodscrews in chipboard and different types of wood. Chipboard screws have many technical improvements which ensure easy, and with modern tools, fast assembly, so saving on total costs.

### Properties

The benefits are achieved by the following properties: adapted geometry of the thread, the thread angle of the wood thread has been diminished from 60° to 40°.

### Advantages

With the same major diameter the minor diameter is smaller and of equal thickness over the full screwlength (except the point). The normal length chipboard screws have thread, till just under the head. Depending on availability can be supplied fully threaded as well as partly threaded. A sharp selfcentering point, through which easier start of drilling and less risk of wobbling. Expensive and time-consuming pre-drilling is often unnecessary. The sharper and deeper profile of the thread does not push aside the material, but cuts into it. Less risk of crumbling and splitting of small, crosscut sides e.g. with the installation of door and window furniture. Besides this a better grip (up to 35% higher pull-out values) and up to 40% lower installation torque.

### Material

Chipboard screws are made of casehardened steel and surface-hardened. They are stronger and more wear resistant than woodscrews, increasing the cutting performance and preventing damage during installation. A toughened core avoids breaking of screw head at bending.

### Assembly

Chipboard screws are provided with a special corrosion resistant lubricant causing a decrease of the installation torque.

### Recess

Although chipboard screws are available from stock in the slotted condition, for industrial use screws with a **Pozidriv (Z)** cross recess are preferred, which can be efficiently tightened with automatic setting tools.

### Types

Besides the normal chipboard screws f.i. the slotted version, Pozidriv (Z) cross recessed and hexalobular recessed are also available the HECO-FIX and the VBA PLUS chipboard screws, see relevant product pages for more detailed information.

- Specific features HECO-FIX PLUS screws for chipboard:
- Reduction of required drive torque of up to 30%.
- Easier handling.
- Substantially higher screwing performance on using storage battery screw drivers.
- Axial forces are reduced, thereby less wear of screw driver bits.
- By means of the tooth geometry, a higher unscrewing moment is nevertheless, achieved and consequently, a secure screwed connection is obtained.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement

- A deeper Pozidriv (Z) cross recess which practically eliminates "slipping out" of the tool.
- A saw-tooth shaped thread form which results in a lower turning moment, a higher tensile value and reduces deformation in the materials to be joined.
- Fully threaded to the point (point of application) which ensures immediate penetration (biting) of the screw thread, resulting in a 30% reduction of turning time
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

## TTAP® Drive

*ttap® is an innovative new hex-lob drive system with distinctive advantages compared to the generic hex-lob (Torx®). ttap® is a drive system designed to work excellently with all types of assembling, including demanding professional applications. The stick-fit, no wobbling feature enables one handed operations without the use of a magnetic bitholder. ttap® makes screw assembling easier and at lower costs.*

### Plus facile:

- Stick-fit; screwdriver «sticks-fit» in the recess
- No wobbling; screwdriver does not wobble out of the recess, does not cam out
- No need to push; no end-load on screwdriver needed
- one-handed operation is possible
- no magnetic bit holder needed and thus there are no steel splinters to clog the bit
- Screwdriver enters the screw recess more easily

### Cost efficient:

- Reduce tool usage
- Improved productivity
- Reduced risk to damage rust protection plating
- Better profits and job moral

### Hex-Lob (Torx®) Compatible

- TTAP® is 100 % a hexalobular recess, backward convertible - but without the disadvantages
- You can use Torx® bits on TTAP® screws, hence, strategically easy to change to TTAP®

### Benefits your health

- No need to push - no end-load on screwdriver needed
- If you compare ttap® with Phillips or Pozidrive recess, a major advantage is that you don't need to apply as much pressure to drive the screw, hence - ttap® reduces worker fatigue

## Universal woodscrew countersunk head with ttap®

### Technical data

| d   | dk | k   | No. ttap |
|-----|----|-----|----------|
| 3   | 6  | 3,5 | 10       |
| 3,5 | 7  | 4,0 | 15       |
| 4   | 8  | 4,5 | 20       |
| 4,5 | 9  | 5,0 | 20       |
| 5   | 10 | 5,5 | 25       |
| 6   | 12 | 6,3 | 25       |

- Full boxes only.
- F=9mm only if L≥40mm.

- Specific features HECO-FIX PLUS screws for chipboard:
- Reduction of required drive torque of up to 30%.
- Easier handling.
- Substantially higher screwing performance on using storage battery screw drivers.
- Axial forces are reduced, thereby less wear of screw driver bits.
- By means of the tooth geometry, a higher unscrewing moment is nevertheless achieved and consequently, a secure screwed connection is obtained.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

- Specific features HECO-FIX PLUS screws for chipboard:
- Reduction of required drive torque of up to 30%.
- Easier handling.
- Substantially higher screwing performance on using storage battery screw drivers.
- Axial forces are reduced, thereby less wear of screw driver bits.
- By means of the tooth geometry, a higher unscrewing moment is nevertheless, achieved and consequently, a secure screwed connection is obtained.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

**29368 HECO-FIX PLUS Cross recessed raised cheese head screw for chipboard Pozidriv** K04A

- Specific features HECO-FIX PLUS screws for chipboard:
- Reduction of required drive torque of up to 30%.
- Easier handling.
- Substantially higher screwing performance on using storage battery screw drivers.
- Axial forces are reduced, thereby less wear of screw driver bits.
- By means of the tooth geometry, a higher unscrewing moment is nevertheless achieved and consequently, a secure screwed connection is obtained.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

- Specific features VBA PLUS screws for chipboard:
- The screw head is marked with an + which indicates that the VBA PLUS screw is, and will remain a quality screw.
- A deeper Pozidriv (Z) cross recess which practically eliminates "slipping out" of the tool.
- A saw-tooth shaped thread form which results in a lower turning moment, a higher tensile value and reduces deformation in the materials to be joined.
- Fully threaded to the point (point of application) which ensures immediate penetration (biting) of the screw thread, resulting in a 30% reduction of turning time.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

- Plain washers without chamfer acc. to DIN 125-1 A with a minimum hardness of 140HV.
- Because of the low compression strength these plain washers are exclusively appropriate in combination with bolts with property class < 8.8 c.q. with nuts with property class < 8.

- Titanium ASTM Grade 2 (materialnumber 3.7035) with a high percentage of pure titanium, ensures product stability and -suitability in extremely corrosive environments where other materials i.e. stainless steel fail.
- Titanium Grade 2 is also suitable for other light loaded applications.

## Plain washer

ISO 7091  
 DIN 126

- Spring washers acc. to DIN 127 B should be used in combination with fasteners of property class  $\leq 5.8$ , use under dynamic load is not allowed.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.
- Depending on availability these articles can be supplied zinc plated as well as mechanical plated.
- WARNING: electro-galvanizing of these products may cause hydrogen embrittlement

- Spring lock washers acc. to DIN 7980 should be used in combination with fasteners of property class < 8.8, use under dynamic load is not allowed.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.
- Depending on availability these articles can be supplied zinc plated as well as mechanical plated.
- Warning: electro-galvanizing of these products may cause hydrogen embrittlement.

- Spring lock washers acc. to DIN 7980 should be used in combination with fasteners of property class < 8.8, use under dynamic load is not allowed.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.
- Depending on availability these articles can be supplied zinc plated as well as mechanical plated.

- Spring washers acc. to DIN 137 should be used in combination with fasteners of property class < 5.8, use under dynamic load is not allowed.
- They are intended to counteract the effect of "play or setting" which results in bolt/nut assemblies working loose (see DIN 267-26).
- They do not effectively prevent loosening of the assembly under varying radial load and are designed for use with short bolts predominantly subject to thrust.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.
- **Warning:** electro-galvanizing of these products may cause hydrogen embrittlement.

- Spring washers acc. to DIN 137 should be used in combination with fasteners of property class < 5.8, use under dynamic load is not allowed.
- They are intended to counteract the effect of "play or setting" which results in bolt/nut assemblies working loose (see DIN 267-26).
- They do not effectively prevent loosening of the assembly under varying radial load and are designed for use with short bolts predominantly subject to thrust.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.

- Curved spring lock washers acc. to DIN 128 A are improved compared to spring lock washers acc. to DIN 127 A and due to the curved form have moreover the advantages: do not damage surfaces of the construction, nut or bolt; also to use with left hand thread; do not disform during tightening and dis-assembly, thus re-useable; do not tangle, so suitable for automatic feeding and should be used in combination with fasteners of property class < 8.8, use under dynamic load is not allowed.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers, see elsewhere in this section.

- The measurements deviate slightly from DIN 128 A, these spring lock washers have a deviating "reinforced" thickness resulting in considerably improved spring characteristics.
- Curved spring lock washers acc. to DIN 128 A are improved compared to spring lock washers acc. to DIN 127 A and due to the curved form have moreover the advantages: do not damage surfaces of the construction, nut or bolt; also to use with left hand thread; do not disform during tightening and dis-assembly, thus re-useable; do not tangle, so suitable for automatic feeding. Use under dynamic load is not allowed.
- For locking under dynamic load is referred to NORD-LOCK vibration proof washers and SCHNORR safety washers.
- The austenetic steel type is at the manufacturer's discretion, and can vary from the steel types stated in DIN 267-11.

Special features of FABORY locking edge washers:

- applicable with hexagon head bolts, hexagon nuts, etc. of property class ≤ 8.8
- the profile surface (patented) ensures good locking against loosening properties and reduces loss of assembly pre-load
- compensation against play or setting of the joint by a long spring deflection
- little damage, so also usable with softer materials and surface coatings
- re-usable
- suited for automatic installation
- insensitive for temperature from -10°C up to +300°C
- sizes and other properties according to DIN 128 A
- simple application together with current standard fasteners
- also applicable for hexagon head bolts, hexagon nuts etc. with left-hand thread

- The main purpose of toothed lock washers is to permit the flow of electric current between components coated by varnish, anti-corrosive agents or similar materials, the bend ends of the washers piercing the coating when such components are joined. Where such washers are intended to keep fasteners of a low property class from working loose, their effectiveness shall be checked for the application concerned.
- Internal teeth and extra large outside diameter d<sub>2</sub>, extra resilience because of its domed form.

- The main purpose of toothed lock washers is to permit the flow of electric current between components coated by varnish, anti-corrosive agents or similar materials, the bend ends of the washers piercing the coating when such components are joined. Where such washers are intended to keep fasteners of a low property class from working loose, their effectiveness shall be checked for the application concerned.
- Double serrated teeth and extra large outside diameter d<sub>2</sub>. Recommended for oversize and elongated holes, where a larger contact surface is required and between parts to prevent them from moving.

- The main purpose of toothed lock washers is to permit the flow of electric current between components coated by varnish, anti-corrosive agents or similar materials, the bend ends of the washers piercing the coating when such components are joined. Where such washers are intended to keep fasteners of a low property class from working loose, their effectiveness shall be checked for the application concerned.
- Suitable for bolts and nuts with normal widths across flats.

- The main purpose of toothed lock washers is to permit the flow of electric current between components coated by varnish, anti-corrosive agents or similar materials, the bend ends of the washers piercing the coating when such components are joined. Where such washers are intended to keep fasteners of a low property class from working loose, their effectiveness shall be checked for the application concerned.
- Suitable for bolts and nuts with widths across flats smaller than normal and when due to the appearance the teeth are wanted on the internal side.

- Disc springs acc. to DIN 2093 are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of the disc springs above meet the highest expectations with reference to the static and dynamic load. They exceed the requirements of DIN 2093.
- Material group 1:  $t < 1,25$  from steel Ck 75.
- Material group 2:  $1,25 \leq t \leq 6,0$  from steel 50 Cr V4 (fatigue fractures can be largely prevented because these disc springs have machined edges).
- $F$  = spring force in Newton at a deflection  $s \approx 0,75 h_0$  ( $h_0 = L_0 - t$ ).
- Nominal thickness. For the calculation of disc springs, see DIN 2092.
- Extensive technical data available on request.

### Example of application

Ball valve

- The disc springs mentioned above acc. to ≈ DIN 2093 are suitable for general use. For more critical applications it is advised to choose disc springs from the article groups 36300, 36302, 36303 and 36450.
- Group 1:  $t < 1,25$  from steel CS70 acc. to BS 1449-1.
- Group 2:  $1,25 \leq t \leq 6,0$  from steel 50 Cr V4 (edges of these disc springs are not machined).
- F = spring force in Newton at a deflection  $s \approx 0,75 h_0$  ( $h_0 = L_0 - t$ ).
- Type A: execution heavy ( $D_e/t \approx 18$ ).
- Type B: execution medium ( $D_e/t \approx 28$ ).
- Type C: execution light ( $D_e/t \approx 40$ ).
- If the type is not mentioned, the concerning dimension is not DIN standardised.
- For the calculation of disc springs, see DIN 2092.

- Conical spring washers acc. to DIN 6796 should be used in combination with fasteners of property class 8.8 and 10.9, use under dynamic load is not allowed.
- For locking under dynamic load is referred to locking edge washers, SCHNORR safety washers and NORD-LOCK vibration proof washers.

7

- Disc springs are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of these disc springs meet the highest expectations with reference to the static and dynamic load. They exceed the requirements of DIN 2093.
- Material group 1:  $t < 1,25$  from steel Ck 67.
- Material group 2:  $1,25 \leq t \leq 6,0$  from steel 50 Cr V4.
- Material group 3:  $6,0 > t \leq 14,0$  from steel 50 Cr V4.
- Fatigue fractures can be largely prevented because the disc springs of material group 2 and 3 have machined edges.
- $F$  = spring force in Newton at a deflection  $s \approx 0,75 h_0$  ( $h_0 = L_0 - t$ ).
- For the calculation of disc springs, see DIN 2092.
- Extensive technical data available on request.

- Disc springs acc. to DIN 2093 are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of the disc springs above meet the highest expectations with reference to the static and dynamic load. They exceed the requirements of DIN 2093.
- Material group 1:  $t < 1,25$  from steel Ck 75.
- Material group 2:  $1,25 \leq t \leq 6,0$  from steel 50 Cr V4 (fatigue fractures can be largely prevented because these disc springs have machined edges).
- $F$  = spring force in Newton at a deflection  $s \approx 0,75 h_0$  ( $h_0 = L_0 - t$ ).
- For the calculation of disc springs, see DIN 2092.
- Extensive technical data available on request.

- Disc springs acc. to » DIN 2093 A are mostly used in critical applications with safety first. Similar applications can be found in for example safety torque limiter clutches, hinge stiffeners and applications of constant roll pressure. Because of the right combination c.q. stacking of the disc springs the elasticity and/or deflection can be dosed accurately. The technical specifications of the disc springs above meet the highest expectations with reference to the static and dynamic load. Heat treatment gives a copper-bronze colour to this disc springs.
- $D_e$  (h12) 8-10-12,5-14-16-18-20-22,5-25-28-31,5-40 X 12 CrNi 17 7 (Werkstoffnr. 1.4310).
- $D_e$  (h12) 35,5-50-56-71 X 35 CrMo 17 (Werkstoffno. 1.4122).

- A ISO 10683 Zinc Flake surface coating eliminates the possibilities of damage which can arise due to hydrogen embrittlement.

# NORD-LOCK®

**NORD-LOCK is a superior bolt securing system that provides safe locking for bolted joints even when exposed to severe vibration and dynamic load.**

- Makes the bolt self-locking
- Facilitates maintenance work
- Controllable preload
- No special tools required
- Reusable

NORD-LOCK consists of a pair of washers with a wedge-locking action meeting DIN 25201 which is a unique method using tension instead of friction. The rise of the cams between the NORD-LOCK washers is greater than the pitch of the bolt. In addition, there are radial teeth on the opposite side. The washers are installed in pairs, cam face to cam face.

7

When the bolt and/or nut is tightened the teeth grip and seat the mating surfaces. The NORD-LOCK washer is locked in place, allowing movement only across the face of the cams. Any attempt from the bolt/nut to rotate loose is blocked by the wedge effect of the cams.

Here you see what happens when a bolt is untightened with a wrench. The pair of washers expand more than the corresponding pitch of the thread allows the bolt/nut to rise.

- For general information concerning NORD-LOCK vibration proof fasteners, see INFO-page.
- Vibration proof washers with large outside diameter are recommended for oversize and elongated holes, where a larger contact surface is required.
- Technical brochure available on request.

Special features of SCHNORR safety washers:

- contact first on the outside diameter, resulting in maximum leverage
- high vibration security due to the rib contact
- can be used with screws of property class ≤ 8,8 and ≤ 8,0

Special features of SCHNORR safety washers type VS:

- reinforced execution (increased metal thickness) resulting in considerably improved spring characteristics
- contact first on the outside diameter, resulting in maximum leverage
- high vibration security due to the rib contact
- can be used with screws of property class  $\leq 10,9$  and on hardened surface

Special features *FABORY* contact-lock washers type medium:

- suitable for use simultaneously as lock washer and plain washer with oversize or elongated holes
- no damage to surface, exceptional locking action and high elasticity to compensate play or setting
- excellent contact in electrical appliances avoiding overheating
- applicable for bolts with a property class  $\leq 10.9$

- Special features of contact-lock washers type P:
- Suitable for use simultaneously as lock washer and plain washer with oversize or elongated holes
- No damage to surface, exceptional locking action and high elasticity to compensate play or setting
- Excellent contact in electrical appliances avoiding overheating
- Provided with six sharp points (height 0,3 mm), they penetrate the possible coat of laquer and will provide an excellent earthing
- Applicable for bolts with a property class ≤ 10.9

7

Special features DUBO retaining rings:

- locks, because the retaining ring forms itself around the hexagon
- seals, because the ring is pressed into the thread and bolt hole
- reduces noise, because the plastic-elastic behaviour absorbs vibrations
- insulates against electrolytic contact corrosion by connection of different metals
- temperature resistant from -60°C to +120°C with static load and from -60°C to +80°C with dynamic load
- hexagon nuts and bolts from class 8.8 resp. 8 and above, DUBO retaining rings have to be used together with a steel DUBO toothed collar ring

- Stainless steel circlips are made of martensitic stainless steel.
- In assemblies it is essential to use assembly pliers with a screw for limitation the opening-closing of the ring.
- Furthermore it is advisable to apply a minimum on clamping on the shaft or housing if the application permits it.
- Also avoid contact with chloride containing liquids (cleaning) to reduce the risk of 'stress corrosion cracking'.

## Retaining ring for bores - normal type

DIN 472  
 NF E22-165  
 BS 3673-4

- Stainless steel circlips are made of martensitic stainless steel.
- In assemblies it is essential to use assembly pliers with a screw for limitation the opening-closing of the ring.
- Furthermore it is advisable to apply a minimum on clamping on the shaft or housing if the application permits it.
- Also avoid contact with chloride containing liquids (cleaning) to reduce the risk of 'stress corrosion cracking'.

## Retaining washer for shafts

DIN 6799  
BS 3673-2

- Special features of clamp-adjusting rings:
- Simple installation, low loading of the shaft.
- Compensates tolerance variations of the shaft.
- Simple dis-assembly and precise moveable.
- The shaft remains undamaged due to no metal disformation during tightening.
- Equal division of clamping force over the circumference.

## Bonded seal with rubber

- Special features of bonded seals:
- Are particularly suitable for screw connections, pipe joints, hose couplings etc.
- The sealing lip of nitrile rubber is resistant to mineral oil, water, gas and numerous other media.

- Pull-out force in kN at the largest possible screw diameter, (values in bold print), and a correct mounting of the wall plug in a supporting surface.
- It is advised to take a safetyfactor of ≥ 5.
- When using chipboard screws, the values should be reduced by 30%.
- Because of the possible variation in joint quality, the values apply only to fixing operations in brick.

- Pull-out force in kN at the largest possible screw diameter, (values in bold print), and a correct mounting of the plug in a supporting surface.
- It is advised to take a safetyfactor of  $\geq 7$ .

- Special features of MOLLY screw anchors:
- Ideally suited for cavity materials e.g. walls, building bricks, soft materials e.g. plasterboard, wood, chipboard, etc.
- Blind installation from one side with a screwdriver and key type MJ68 or handplier type BT2000.
- Permanent anchoring which can be used unlimitedly.
- Provided with pointed hooks preventing turning.
- Large contact area by spreaded wings.

- DRIVA self-drilling anchors are made of Zamac 3 (zinc alloy), type TP 12 with zinc plated screws for back panels and type TF 27 with zinc plated countersunk screw.
- The named values are successively applicable for plasterboard 10 mm, plasterboard 13 mm and cellular concrete (6 mm pre-drill).
- It is advised to take a safetyfactor  $\geq 5$ , due to the many different qualities of plasterboards.

#### 70882 DRIVA PLUS Self-drilling anchor for plasterboard

| Stone ≥ 15 N/mm <sup>2</sup> (Mz/KS/HSV) | 0,2  | 3,35 | 0,55 | 0,9  | 1,3 | 1,6  |

- Drilling depth = fixing part + coating layer + length of plug + 10 mm.
- Length of screw = fixing part + coating layer + length of plug.
- It is advised to take a safetyfactor.

#### Special features of expanding plugs:

- provided with a conical inner side, expanding equally against the wall of the hole during tightening
- application for installation through the fixture hole
- they can be applied in concrete, stone, bricks, tiles and massive wood
- resistant against corrosion
- resistant against temperatures up to 200°C

- d<sub>0</sub> = Nominal diameter of drill bit.
- t = Recommended drilling depth.
- h<sub>ef</sub> = Effective anchorage depth.
- l<sub>s min.</sub> = Screw-in depth min.
- l<sub>s max.</sub> = Screw-in depth max.
- k<sub>N</sub> = Load in kN in combination with 8.8 bolts.
- The cone must be installed with setting tool type EAW H (narrow end) into the anchor body (article group 63322).
- Only part of the approval for light suspended ceilings.
- For further technical data the approval is available on request.

- d<sub>o</sub> = Nominal diameter of drill bit
- s = Width across flats
- ring ø = Washer diameter
- d<sub>f</sub> = Diameter of clearance hole in the fixture
- h<sub>1</sub> = Recommended drilling depth
- h(nom) = Minimum hole depth
- h<sub>ef</sub> = Effective anchorage depth
- S<sub>cr, N</sub> = Spacing characteristic
- C<sub>cr, N</sub> = Edge distance characteristic
- t<sub>fix</sub> (max) = Grip range
- T<sub>inst</sub> = Tightening torque in Nm
- N<sub>rec</sub> = Recommended load in kN
- The allowable load is valid for one single anchor, at cracked concrete (tensile zone) with concrete class C20/25, incl. partial safety factor γ<sub>f</sub> = 1,4 and if the S<sub>cr, N</sub> and C<sub>cr, N</sub> are taken in to account.
- When reduction on spacing and edge distance take place a re-calculation of forces should be carried out by making use of the technical guide or calculation software, they are available on request.

- **Code** = Letter code marking.
- **d<sub>o</sub>** = Nominal diameter of drill bit.
- **T<sub>inst</sub>** = Tightening torque in Nm.
- **d<sub>f</sub>** = Diameter of clearance hole in the fixture.
- **h<sub>min</sub>** = Minimal thickness of concrete member.
- **h<sub>o</sub>** = Recommended drilling depth.
- **t<sub>fix</sub>** = Thickness of the fixture.
- **h<sub>ef</sub>** = Effective anchorage depth.
- **S<sub>cr, N</sub>** = Spacing characteristic.
- **C<sub>cr, N</sub>** = Edge distance characteristic.
- **S<sub>min</sub>** = Minimal spacing.
- **C<sub>min</sub>** = Minimal edge distance.
- **N** = Allowable load in kN.
- The allowable load is valid for one single anchor, at non-cracked concrete (pressure zone) with concrete class C20/25, incl. partial safety factor  $\gamma_f = 1,4$  and if the  $S_{cr, N}$  and  $C_{cr, N}$  are taken in to account.
- When reduction on spacing and edge distance take place a re-calculation of forces should be carried out by making use of the technical guide or calculation software, they are available on request.
- Final calculations should comply with the complete European Technical Approval (ETA), this approval is also available on request.

### Assembly sequence

- d<sub>o</sub> = Nominal diameter of drill bit.
- t<sub>fix</sub> = Grip range.
- h<sub>ef</sub> = Effective anchorage depth.
- Min. t<sub>d</sub> = Recommended drilling depth.
- k<sub>N</sub> = Load in kN.
- The allowable load is valid for one single anchor, at cracked concrete (tensile zone) with concrete class C20/25, incl. partial safety factor γ<sub>f</sub> = 1,4 and if the S<sub>cr, N</sub> and C<sub>cr, N</sub> are taken in to account.

- When reduction on spacing and edge distance take place a re-calculation of forces should be carried out by making use of the technical guide or calculation software, they are available on request.
- Final calculations should comply with the complete European Technical Approval (ETA), this approval is also available on request.

8

- d<sub>0</sub> = Nominal diameter of drill bit.
- Min. t<sub>d</sub> = Recommended drilling depth.
- h<sub>ef</sub> = Effective anchorage depth.
- t<sub>fix</sub> = Grip range.
- s = Width across flats.
- k<sub>N</sub> = Load in kN.
- The allowable load is valid for one single anchor, at cracked concrete (tensile zone) with concrete class C20/25, incl. partial safety factor γ<sub>f</sub> = 1,4 and if the S<sub>cr</sub>, N and C<sub>cr</sub>, N are taken in to account.
- When reduction on spacing and edge distance take place a re-calculation of forces should be carried out by making use of the technical guide or calculation software, they are available on request.
- Final calculations should comply with the complete European Technical Approval (ETA), this approval is also available on request.

## LIEBIG Anchors

### General

LIEBIG anchors are mechanically expanding fixtures for anchoring in ready concrete of heavy-duty constructions with safe working loads as indicated in the approvals of the "Institute für Bautechnik" (IfBT) in Berlin.

### Types

Three types are available from stock: the LIEBIG safety bolt type B and type S and the LIEBIG anchor type AB with following advantages:

- they are approved (Zulassung of the IfBT) and a periodical quality control is exercised by the "Institut für Massivbau an der T.H. Darmstadt"
- suited for drill-trough and drop-in method by using the recommended drillhole in the construction to be fastened
- after installation immediately fully loadable
- installation control of expansion force by applying the prescribed tightening torque wrench
- increasing load causes forced expansion because the cone is pressed further into the expansion sleeve
- the essential difference between the anchor types is characterised by the way the expansion of the sleeve is realised

### LIEBIG safety bolt type B and type S

The clamping force against the wall of the hole is realised in a cylindrically expanding way because during tightening the hardened steel sleeve will break at pre-calibrated points via the second cone, pressing the shields with its whole surface parallel against the wall of hole. Through this, high pull-out forces and an even equalisation of pressure are obtained in the concrete. The domed washer will be flattened at the prescribed tightening torque so giving an extra optical control on right installation. The thick walled expansion shields guarantee high expansion reserves and equalize drillhole tolerances. As a consequence of these properties the efficiency of this type is higher than that of a conically expanding anchor. In other words tightening torque and assembly pre-load are converted into an optimal clamping force.

### LIEBIG anchor type AB

Only one cone is pulled into the expansion sleeve giving single conical expansion deep into the hole. The flattening of the feet under the washer guarantees clamping pressure by pulling the material to be fastened tight against the concrete.

### Assembly data

LIEBIG safety bolt type B and type S

LIEBIG anchor type AB

For anchoring DURING casting concrete, see VEMO concrete inserts.

## Safety bolt type B

## Setting tool

- For a complete chemical fixing, the resin capsule and threaded rod (incl. nut and washer) have to be ordered separately.
- Threaded rod type RG M can be installed with installation tool type M.
- These threaded rods are also suitable for injection system type FIS.
- For further technical data the approval is available on request.

Packaging Standard

✉ [Art.number](#)

FIS VS 300 T

1 [63252.000.300](#)

- High performance hybrid mortar for high loads in almost all building materials.
- Universal mounting system for a wide range of applications on site.
- Expansion-free anchoring allows low spacing and edge distances.
- Extensive range of accessories for a wide variety of applications.
- The use of standard caulking gun is economically advantageous.

- Incl. 2 static mixers
- Contents 360 ml
- Expansion-free anchoring with an optimal price/quality relation
- High-strength rapid-setting 2-component synthetic resin mortar
- Open cartridges can be used repeatedly
- Easy application with injection pistol, see article group 63691
- No separate mixing required
- Incl. 2 static mixers
- Contents 380 ml

**63060 FISCHER Injection cartridge** N03A

Packaging Standard

VS150C

1 [63060.000.150](#)

- Expansion-free chemical anchoring system for professional and semi-professional applications
- Styrene free hybrid resin mortar
- The 2 components are safely mixed together inside the static mixer
- A simple exchange of the static mixer allows the renewed use of cartridges after they have been opened
- Requires low application pressure for economical use
- Incl. ejection plunger and 2 static mixers
- Contents 145 ml
- Can be extruded from the cartridge with conventional sealant pistols

| Spacing ( $S_{cr, N}$ ), characteristic             | 110          | 140           | 200           | 270            | 300             |
| Edge distance ( $C_{cr, N}$ ), characteristic       | 55           | 70            | 100           | 135            | 150             |
| Minimal spacing ( $S_{min.}$ )                      | 40           | 45            | 55            | 60             | 65              |
| Minimal edge distance ( $C_{min.}$ )                | 40           | 45            | 55            | 60             | 65              |
| Screw-in depth (min.-max.)                          | 8-35         | 9-35          | 12-45         | 15-45          | 18-45           |
| N=Allowable load in kN                              | 3,4          | 4,8           | 8,7           | 13,8           | 16,5            |

- The allowable load is valid for one single anchor, at non-cracked concrete (pressure zone) with concrete class B25, in combination with boltclass 5.8 and/or stainless steel A4-70 and if the  $S_{cr, N}$  and  $C_{cr, N}$  are taken in to account. When reduction on spacing and edge distance take place a re-calculation of forces should be carried out.
- For a complete chemical fixing, the resin capsule and internal threaded anchor have to be ordered separately. Setting tool is enclosed in each packing.
