- For hot dip galvanized bolts with OVERSIZED thread the zinc layer is applied ON the normal thread, so AFTER galvanizing these bolts are no longer ISO-metric mating, but thicker: so called OVERSIZED.
- They do not mate the usual fit of screwthread and cannot be used in e.g. normal threaded holes.
- The corresponding OVERSIZED nuts have been tapped about 0,3 mm larger AFTER galvanizing running perfectly onto these bolts.

- Special features hexagon head bolts for pressure vessels etc.:
- Are intended for use in pressure vessels, steam apparatus, equipment and flanged joints at temperatures from -10°C up to +300°C, overpressures max. 40 bar and sizes up to and including M30.
- Meets the requirements of AD-Merkblatt W7, TRD 106 of the TÜV (Technischer Überwachungsverein) and DIN 267-13.
- According to TÜV-Merkblatt Werkstoffe 1253, the manufacturer has been certified to deliver these bolts without a 3.1 certificate, the trade-mark and class designation are sufficient.
- This certification is also accepted by the Dutch "STOOMWEZEN BV" and meets the requirements M0802.

- Special features hexagon head bolts:
- Made of steel 24 Cr Mo 5 materialnumber: 1.7258.
- Intended for use at high temperatures up to 400°C.
- Threadlengths not acc. to ISO 4014.
- Mechanical properties acc. to DIN 17240.
- The bolthead is marked with the marking sign G, acc. to DIN 267-13.

- For hot dip galvanized bolts with ISO-METRIC FITTING thread, the thread is rolled undersize so that it will meet the go-gauge with tolerance class h AFTER galvanizing.
- The advantage of this way of manufacturing is that the bolts can be used in any threaded hole without any problem.
- The corresponding ISO-METRIC FITTING nuts have been threaded according to the tolerance class 6H AFTER galvanizing so that they perfectly fit onto the bolts.

- Special features hexagon head screws for pressure vessels etc.:
- Are intended for use in pressure vessels, steam apparatus, equipment and flanged joints at temperatures from -10°C up to +300°C, overpressures max. 40 bar and sizes up to and including M30.
- Meets the requirements of AD-Merkblatt W7, TRD 106 of the TÜV (Technischer Überwachungsverein) and DIN 267-13.
- According to TÜV-Merkblatt Werkstoffe 1253, the manufacturer has been certified to deliver these screws without a 3.1 certificate, the trademark and class designation are sufficient.
- This certification is also accepted by the Dutch "STOOMWEZEN BV" and meets the requirements M0802.

- Titanium ASTM Grade 2 (materialnumber 3.7035) with a high percentage of pure titanium, ensures product stability and -suitability in extremely corrosive environments where other materials i.e. stainless steel fail.
- Titanium Grade 2 is also suitable for other light loaded applications.

- Grade 5 acc. to the American standards SAE J429/ASTM A449 (marking sign ) corresponds much the same with property class 8.8 acc. to ISO 898-1. When the bolts are also marked with 8.8, then they meet the properties of property class 8.8. Depending on availability also the equal class S acc. to BS 1768 (marking sign S) can be supplied.

| <b>Packaging</b>         | Standard                |

- Grade 5 acc. to the American standards SAE J429/ASTM A449 (marking sign ) corresponds much the same with property class 8.8 acc. to ISO 898-1. When the bolts are also marked with 8.8, then they meet the properties of property class 8.8. Depending on availability also the equal class S acc. to BS 1768 (marking sign S) can be supplied.

#### 02000 Hexagon head bolt UNF

X01A

**Thread** Unified National Fine  
**Material** Steel  
**Class** Grade 5  
**Packaging** Standard

- Grade 5 acc. to the American standards SAE J429/ASTM A449 (marking sign ) corresponds much the same with property class 8.8 acc. to ISO 898-1. When the bolts are also marked with 8.8, then they meet the properties of property class 8.8. Depending on availability also the equal class S acc. to BS 1768 (marking sign S) can be supplied.
- If when ordering, UNF 1 inch-12 is not stated, then we supply the type with 14 threads per inch (UNS).

- Grade 5 acc. to the American standards SAE J429/ASTM A449 (marking sign ) corresponds much the same with property class 8.8 acc. to ISO 898-1. When the bolts are also marked with 8.8, then they meet the properties of property class 8.8. Depending on availability also the equal class S acc. to BS 1768 (marking sign S) can be supplied.
- If when ordering, UNF 1 inch-12 is not stated, then we supply the type with 14 threads per inch (UNS).

- Grade 5 acc. to the American standards SAE J429/ASTM A449 (marking sign ) corresponds much the same with property class 8.8 acc. to ISO 898-1. When the bolts are also marked with 8.8, then they meet the properties of property class 8.8. Depending on availability also the equal class S acc. to BS 1768 (marking sign S) can be supplied.
- If when ordering, UNF 1 inch-12 is not stated, then we supply the type with 14 threads per inch (UNS).

## Hexagon head screw BSF

BS ≈1083 (1965)

### Technical data

| d    | Threads per inch | F   | A     |
|------|------------------|-----|-------|
| 1/4  | 26               | 4,6 | 0.445 |
| 5/16 | 22               | 5,5 | 0.525 |
| 3/8  | 20               | 6,6 | 0.6   |
| 1/2  | 16               | 8,7 | 0.82  |

- Whitworth thread (BSW/BSF) is not internationally recommended. It is advised to use metric (M/MF) or unified threads (UNC/UNF).
- Minimum Grade R acc. to ≈ BS 1083 (1965) corresponds much the same with property class 6.8 acc. to DIN ISO 898-1. The bolthead is marked with the symbol of property class R.

Special features of RIPP self-locking hexagon bolts with flange:

- the serrated flange eliminates surface damage during assembly, prevents self-loosening and reduces relaxation
- the flange enables built up forces under the bolt head to be spread over a larger area, consequently resulting in lower surface pressure
- large holes (oversized) and/or tooling holes can be covered by the flange
- a washer and/or a locking element is not necessary

- RIPP self-locking hexagon bolts with flange are designated with the property class 100 with a min. tensile strength of  $1040 \text{ N/mm}^2$ , they are case hardened and therefore cannot be classified in the usual class 10.9.
- WARNING: electro-galvanizing of these products may cause hydrogen embrittlement.

Special features of TENSILOCK self-locking hexagon nuts:

- the resilient serrated flange gives excellent self-locking properties
- inside of the resilient flange serration there is an optimal preloading of the construction with minimal settlement
- a washer and/or locking element is not necessary and is even not advisable

- Special features of hexagon bolts with toothed flange:
- The flange enables built up forces to be spread over a larger area, consequently resulting in lower surface pressure
- Large holes (oversized) and/or tooling holes can be covered by the flange
- A washer is not necessary
- Toothened flangebrim gives excellent self-locking properties

- Special features of hexagon bolts with flange:
- The flange enables built up forces to be spread over a larger area, consequently resulting in lower surface pressure.
- Large holes (oversized) and/or tooling holes can be covered by the flange.
- A washer is not necessary.

- For hot dip galvanized bolts with OVERSIZED thread the zinc layer is applied ON the normal thread, so AFTER galvanizing these bolts are no longer ISO-metric mating, but thicker: so called OVERSIZED.
- The corresponding OVERSIZED nuts have been tapped about 0,3 mm larger AFTER galvanizing running perfectly onto these bolts.

## Seating screw

DIN 15237

1

### Technical data

|    |      |     |
|----|------|-----|
| d1 | M8   | M10 |
| P  | 1,25 | 1,5 |
| d3 | 28   | 35  |

- Applicable for the attachment of conveyor belts to their rollers.
- The cams under the countersunk head fasten the seating screw while the cupped washer under the belt reinforces the connection.

## PEINER High strength structural bolts

### General

From September 2007, manufacturers of high strength structural bolts, nuts and washers should produce their products in accordance with the European standard **EN 14399**. Products made based on the old standards DIN 6914, 6915 and 6916 (old 'DIN stocks') can still be used and supplied, but cannot be combined in various assemblies (see 'Assembly') with products that meet the new standard!

The revised standard does not lead to any important dimensional changes (with the exception of the thread length size "b", which now has the maximum value from the old standard and, starting at M24 even somewhat above that). Furthermore, CE marking on the packaging is obliged and the products demand more stringent assembly instructions and traceability. In addition, the impact value has changed from  $K_{V,min}=20J$  to  $K_{V,min}=27J$  at  $-20^{\circ}C$ . PEINER 10.9 HV high strength structural bolts, nuts and washers that are included in this catalogue meet the new standards.

| Product    | Old      | New          | Marking |
|------------|----------|--------------|---------|
| HV bolts   | DIN 6914 | → EN 14399-4 | 10.9 HV |
| HV nuts    | DIN 6915 | → EN 14399-4 | 10 HV   |
| HV washers | DIN 6916 | → EN 14399-6 | H       |

### Quality

PEINER is a CE-certified supplier of class 10.9 HV bolts, class 10 HV nuts and washers (hardness 300-370 HV) in the sizes M12-M36 in accordance with standard EN 14399-4 resp. EN 14399-6. These articles are available in both a black and a hot-dip galvanised version. The bolts meet all of the requirements that are set to prevent hydrogen embrittlement.

### Assembly

The standard prescribes that the bolt, nut and washer must come from the same manufacturer. Standard EN 14399-2 describes the test method that the bolt/nut/washer combination should fulfill. Due to the more stringent assembly instructions and a classification in k-classes, the manufacturer should ensure that the required preloading force can be achieved in a reliable manner and that overloading is avoided, with reference being made to the assembly methods in standard ENV 1090-1.

For hot-dip galvanised combinations, in the friction class K1, the same tightening torque and preloading forces apply as stated in DIN 18800-7 (2002-09) Table 6, columns 3 and 7, resp. EN 1993-1-8. For hot-dip

galvanised products from the same manufacturer, the various separate elements (in accordance with DIN and EN) can be combined. This is because the values for the tightening torque remain the same!

For the non hot-dip galvanised combinations, according to the new EN standard, the same tightening torques apply as for the hot-dip galvanised combinations, there where DIN 18800-7 (2002-09) Table 6, columns 4 and 8, previously prescribed raised tightening torques. Due to this difference in tightening torque, combining DIN-products with EN-products is **not** allowed.

**Peiner high strength structural bolts that meet the new EN standard are supplied in friction class K1.** The k-factor describes the linear relationship between the tightening torque (M) and the preloading force achieved for the diameter concerned.

Expressed using the formula:  $M = k \times F_v \times d$  (M [Nm],  $F_v$  [kN], d [mm])

PEINER preloading products (EN14399-4 and 6) should meet k-class **K1** where  $0.1 \leq k \leq 0.16$ , irrespective of the surface treatment.

The product packaging mentions assembly guidelines and the friction class. The surface treatment applied by the manufacturer ensures that these conditions are achieved! Additional lubrication or degreasing influences the k-value and is not allowed. With respect to the clamping length of a bolt-nut-washer combination, it must be noted that in the new standard the thickness of the washers is included.

### Certificates

PEINER high strength structural bolts are, on request, available with a 3.1 certificate in accordance with EN 10204.

- New European constructions must comply with the Construction Directive 89/106/EEC in order to ensure safety to persons and objects.
- In most cases this means the application of products according to the harmonized European standards (EN-standards).
- For non-preloaded structural bolting, this means that hexagon bolts and nuts according to EN 15048-1 should be used.
- Compared to the normal bolts ISO 4014/4017 (formerly DIN 931/933) and nuts ISO 4032 (DIN 934) these bolts and nuts have a supplementary marking "SB" (Structural Bolting) and the packaging shows the CE-logo.
- The manufacturers need to be CE-certified for the production of bolts/nuts EN 15048-1.

- New European constructions must comply with the Construction Directive 89/106/EEC in order to ensure safety to persons and objects.
- In most cases this means the application of products according to the harmonized European standards (EN-standards).
- For non-preloaded structural bolting, this means that hexagon bolts and nuts according to EN 15048-1 should be used.
- Compared to the normal bolts ISO 4014/4017 (formerly DIN 931/933) and nuts ISO 4032 (DIN 934) these bolts and nuts have a supplementary marking "SB" (Structural Bolting) and the packaging shows the CE-logo.
- The manufacturers need to be CE-certified for the production of bolts/nuts EN 15048-1.

- New European constructions must comply with the Construction Directive 89/106/EEC in order to ensure safety to persons and objects.
- In most cases this means the application of products according to the harmonized European standards (EN-standards).
- For non-preloaded structural bolting, this means that hexagon bolts and nuts according to EN 15048-1 should be used.
- Compared to the normal bolts ISO 4014/4017 (formerly DIN 931/933) and nuts ISO 4032 (DIN 934) these bolts and nuts have a supplementary marking "SB" (Structural Bolting) and the packaging shows the CE-logo.
- The manufacturers need to be CE-certified for the production of bolts/nuts EN 15048-1.

| 5/8  | 11               | 45                    | 15,9 | 23,8 | 1/2  |
| 3/4  | 10               | 50                    | 19   | 28,5 | 5/8  |

- The mechanical properties corresponds much with the same property class 12.9 acc. to DIN ISO 898-1. Other properties acc. to ASTM A574.
- Marking of these screws is not mandatory.
- ATTENTION: as the product standard specifies thread tolerance 3A for thread sizes up to 1 inch, zinc plating can cause thread fit problems.

- The mechanical properties corresponds much with the same property class 12.9 acc. to DIN ISO 898-1. Other properties acc. to ASTM A574.
- Marking of these screws is not mandatory.
- ATTENTION: as the product standard specifies thread tolerance 3A for thread sizes up to 1 inch, zinc plating can cause thread fit problems.

- Depending on availability these articles can be supplied zinc plated as well as mechanical plated.
- The mechanical properties corresponds much with the same property class 12.9 acc. to DIN ISO 898-1. Other properties acc. to ASTM A574. Marking of these screws is not mandatory.
- ATTENTION: as the product standard specifies thread tolerance 3A for thread sizes up to 1 inch, zinc plating can cause thread fit problems.

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

| M18 (DIN) | 2,5  | 42 | 33    | 8        | 90° | 12  | 60              |
| M20       | 2,5  | 52 | 40,32 | 10,16    | 90° | 12  | 90              |
| M24 (DIN) | 3    | 54 | 39    | 14       | 60° | 14  | 90              |

- All dimensions are guide values and may deviate dependent on the manufacturer.
- Due to the unfavourable geometry of the head, these fasteners have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability need to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by marking the steel grade only and leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the latter indications can occur side by side for some time.

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

- The mechanical properties corresponds much with the same property class 10.9 acc. to DIN ISO 898-1. Due to the unfavourable geometry of the head the tensile strength of these screws is not determined by the cross section of the thread, consequently these screws are permitted to be only partially prestressed. When these steel 10.9 fasteners needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 10.9 --> 010.9.
- Marking of these screws is not mandatory.
- ATTENTION: as the product standard specifies thread tolerance 3A for thread sizes up to 1 inch, zinc plating can cause thread fit problems.

- Whitworth thread (BSW/BSF) is not internationally recommended. It is advised to use metric (M/MF) or unified threads (UNC/UNF).
- Depending on availability also class 12.9 can be supplied. Due to the unfavourable geometry of the head the tensile strength of these screws is not determined by the cross section of the thread, consequently these screws are permitted to be only partially restressed. Consequently these screws are permitted to be only partially prestressed.
- Marking of these screws is not mandatory.
- Depending on availability the dimensions may deviate.

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

| d <sub>k</sub> (max.) | 7,6   | 9,5   | 10,5  | 14    |
| k (max.)              | 2,2   | 2,75  | 3,3   | 4,4   |
| Socket                | No.20 | No.25 | No.30 | No.40 |

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

- RIPP self-locking hexagon bolts with flange are designated with the property class 100 with a min. tensile strength of 1040 N/mm<sup>2</sup>, they are casehardened and therefore cannot be classified in the usual class 10.9.

Special features of RIPP self-locking hexagon bolts with flange:

- the serrated flange eliminates surface damage during assembly, prevents self-loosening and reduces relaxation
- the flange enables built up forces under the bolt head to be spread over a larger area, consequently resulting in a lower surface pressure
- large holes (oversized) and/or tooling holes can be covered by the flange
- a washer and/or a locking element is not necessary

ASSEMBLY PRE-LOAD F<sub>M</sub> in kN and TIGHTENING TORQUE M<sub>A</sub> in Nm

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

- Due to the unfavourable geometry of the head, these fasteners do have reduced load ability.
- When steel fasteners (e.g. 8.8 / 10.9 / 12.9) with reduced load ability needs to be marked, the marking symbol for the property class is preceded by the digit '0'. So 8.8 → 08.8 and 10.9 → 010.9 and 12.9 → 012.9.
- For the stainless steel fasteners it is indicated by only marking the steel grade and by leaving out the property class 70 (e.g. A2-70 → A2).
- The former and the new indications can occur side by side for some time.

### Examples of application

Special features for covers for hexagon socket screws:

- prevent corrosion and dirt accumulation in socket hole
- neat appearance
- easy to assemble and re-useable
- temperature resistant from  $-60^{\circ}\text{C}$  up to  $+120^{\circ}\text{C}$
- colour traffic grey A RAL 7042
- **ATTENTION:** heads of hexagon socket screws can be **partly** covered by these covers

- These hexagon nuts are used among other to hot dip galvanized bolts and screws with ISO-METRIC FITTING thread and to hot dip galvanized threaded rods with ISO-METRIC FITTING thread.
- The nuts are tapped AFTER galvanizing and meet the tolerances 6H.
- The corrosion resistance is not influenced disadvantageously, with assembled nuts, by the uncoated thread.

- Specific features Combiflon:
- It's a fixed dry film coating, colour silver, with reducing effect on galling.
- It levels out the big scatter in coefficient of friction and reduces the average value.
- For a bolt /nut assembly only one product (e.g. the nut) needs to be treated with Combiflon.
- Reduces Bi-metallic corrosion.

3

- Special features of METALFORM:
- Is a dry partly visible lubricant which eliminates the possibility of seizure of threaded stainless steel fasteners.
- In addition the friction coefficient is reduced to a more constant value.
- In a bolt/nut combination it's sufficient that only the nut is lubricated to prevent seizure with METALFORM.
- Can be removed very easily with a solvent after application, so there's no objection of using this application in the food industry.

- Titanium ASTM Grade 2 (materialnumber 3.7035) with a high percentage of pure titanium, ensures product stability and -suitability in extremely corrosive environments where other materials i.e. stainless steel fail.
- Titanium Grade 2 is also suitable for other light loaded applications.

- Special features hexagon nuts for pressure vessels etc.:
- Are intended for use in pressure vessels, steam apparatus, equipment and flanged joints at temperatures from – 10°C up to + 300°C, overpressures max. 40 bar and sizes up to and including M30.
- Meet the requirements of AD-Merkblatt W7, TRD 106 of the "Technischer Überwachungsverein (TÜV)" and resp. ISO 898-2 and DIN 267-13.
- According to TÜV-Merkblatt Werkstoffe 1253, the manufacturer has been certified to deliver these bolts without a 3.1 certificate, the trademark and class designation are sufficient.
- This certification is also accepted by the Dutch "STOOMWEZEN BV" and meets the requirements M0802.

## Hexagon nut MF

- These hexagon nuts are used among other to hot dip galvanized bolts and screws with OVERSIZED thread and to hot dip galvanized threaded rods with OVERSIZED thread.
- The nuts are tapped AFTER galvanizing and DO NOT meet the ISO-metric tolerances.
- The corrosion resistance is not influenced disadvantageously, with assembled nuts, by the uncoated thread.

- Special features of METALFORM:
- Is a dry partly visible lubricant which eliminates the possibility of seizure of threaded stainless steel fasteners.
- In addition the friction coefficient is reduced to a more constant value.
- In a bolt/nut combination its sufficient that only the nut is lubricated to prevent seizure with METALFORM.
- Can be removed very easily with a solvent after application, so theres no objection of using this application in the food industry

- Stainless steel prevailing torque type hexagon nuts with plastic insert can cause seizing of the bolt thread resulting in fracture.
- It is recommended to use METALFORM stainless steel prevailing torque type hexagon nuts with plastic insert (51729 and 51728) or Molykote P-37 (90710.000.500) or Loctite 8009 (90008.009.454) anti-seize and lubricating compound.

- Stainless steel prevailing torque type hexagon nuts with plastic insert can cause seizing of the bolt thread resulting in fracture.
- It is recommended to use METALFORM stainless steel prevailing torque type hexagon nuts with plastic insert (51729 and 51728) or Molykote P-37 (90710.000.500) or Loctite 8009 (90008.009.454) anti-seize and lubricating compound.

| 9/16 | 16               | 16,7 | 7/8   |
| 5/8  | 14               | 19,4 | 15/16 |
| 3/4  | 12               | 22,6 | 1.1/8 |

- These prevailing torque type hexagon nuts are not standardised. Depending on availability the dimensions may deviate.
- Whitworth thread (BSW/BSF) is not internationally recommended. It is advised to use metric (M/MF) or unified threads (UNC/UNF).

- This prevailing torque type hexagon nut is a one piece all metal stainless steel A2 nut.
- The locking is achieved by local radial deformation of the screwthread.

- Special features of type STOVER prevailing torque type hexagon nuts:
- Is a one piece all metal class 8 nut, acc. to DIN 980 V.
- The locking is achieved by local radial deformation of a part of the nut. First the nut runs freely on the thread until the locking part is reached, after which the clamping force increases gradually to a maximum. This progressive locking action with distributed pressure over a large surface prevents damage of the thread.
- Resistant to shocks, vibrations and dynamic loads.
- Re-usable.

- Special features of prevailing torque type hexagon nuts:
- Is a one piece all metal class 8 nut, acc. to DIN 980 V.
- The locking is achieved by local radial deformation of a part of the nut. First the nut runs freely on the thread until the locking part is reached, after which the clamping force increases gradually to a maximum. This progressive locking action with distributed pressure over a large surface prevents damage of the thread.
- Resistant to shocks, vibrations and dynamic loads.
- Re-usable.

- Special features of SNEP prevailing torque type hexagon nuts:
- Is a one piece all metal nut.
- The locking is realised by elastic, axial displacement of the partly separated and compressed parts of the nut in relation to each other. First the nut runs freely on the bolt until the groove is reached, the clamping on the thread is achieved by the elastic reaction of the material independent of the torque.
- Zinc plated with a layer thickness of approx. 7  $\mu\text{m}$ .
- Resistant to shocks, vibrations and dynamic loads.
- Re-useable.
- Temperature resistant from  $-100^{\circ}\text{C}$  up to  $+260^{\circ}\text{C}$ .

Special features of RIPP self-locking hexagon nuts with flange:

- the serrated flange limits surface damage assembly, prevents self-loosening and reduces relaxation
- the flange enables built-up forces under the nut head to be spread over a larger area, consequently resulting in lower surface pressure
- large holes (oversized) and/or tooling holes can be covered by the flange
- a washer and/or a locking element is not necessary

Special features of SECURIT prevailing torque type hexagon nuts:

- is a two-piece all metal nut, consisting of an internal cone in which the thread is tapped and slotted over the full height, and an external cone (being hexagonal with a turner over flange on the top) attached to each other. During torquing the internal cone is clamped around the full circumference of the thread with a progressive force.
- re-usable
- temperature resistant up to +350°C.

- Technical brochure available on request.

Special features of TENSILOCK self-locking hexagon nuts:

- the resilient serrated flange gives excellent self-locking properties
- inside of the resilient flange serration there is an optimal preloading of the construction with minimal settlement
- a washer and/or locking element is not necessary and is not even advisable

- Special features of hexagon nuts with toothed flange:
- The flange enables built up forces to be spread over a larger area, consequently resulting in lower surface pressure.
- Large holes (oversized) and/or tooling holes can be covered by the flange.
- A washer is not necessary.
- Toothened flangebrim gives excellent self-locking properties.

Special features of PAL self-locking counter nuts:

- have to be spun down the thread until finger-tight, then locked by a quarter to half turn with a spanner. Besides the clamping force A, a simultaneous radial force B will be developed causing a locking action
- are often used as locknut above a hexagon nut
- disassembly by tighten the hexagon nut firmly

## KALEI Press nuts

### General

With KALEI press nuts thin sheet material from 1 mm thick can be provided with full loadable thread. This is an ideal solution for the metal- and/or the plastic sheet processing industry.

### Principle

The special formed collar seizes firmly into the material so that the KALEI press nut is secured from pulling loose axially and also from twisting round clockwise viewed from the assembly side.

### Assembly

Centering the KALEI press nut above the drilled or punched hole, (tolerance hole  $d_2 = H11$ ). Mechanical insertion or by hammer through which the serrated collar is seated in the wall of hole (use of an inserting tool simplifies assembly). Screws are turned into the KALEI press nut from the collar side. During tightening the collar will be even further anchored in the material.

### Type

Steel zinc plated and stainless steel with collar heights (kh) from 0,9 mm up to and including 3,9 mm.

Special KALEI press nuts with higher collar heights for application in light-weight materials, plastics etc., and also non-metric KALEI press nuts are available on request.

### Properties

- ideal method to provide thin sheet material with loadable thread
- simple and quick assembly without welding or riveting
- safe seating in sheet material by a specially inclined serrated and case hardened collar
- applicable in steel, aluminium and plastic
- available for several material thicknesses

## Wing nut BSW

DIN ≈313 (1956)  
 NEN ≈2324 (1960)

### Technical data

| d           | Threads per inch | m   | e    | h    |
|-------------|------------------|-----|------|------|
| 1/8 (#DIN)  | 40               | 2,9 | 17,6 | 8,6  |
| 5/32 (#DIN) | 32               | 3,2 | 20   | 10,5 |
| 3/16 (#DIN) | 24               | 4   | 26   | 13   |
| 1/4         | 20               | 5   | 33   | 17   |
| 5/16        | 18               | 6,5 | 39   | 20   |
| 3/8         | 16               | 8   | 51   | 25   |
| 1/2         | 12               | 10  | 65   | 33,5 |
| 5/8         | 11               | 13  | 73   | 37,5 |
| 3/4         | 10               | 16  | 90   | 46,5 |

- Whitworth thread (BSW/BSF) is not internationally recommended. It is advised to use metric (M/MF) or unified threads (UNC/UNF).
- Depending on availability the dimensions may deviate.
- The 1/8 inch wing nuts are the light American type.

## FABORY Blind rivet nuts and bolts

FABORY's blind rivet nut and bolt range is an expert range of more than 14 different series of blind rivet nuts and bolts. It offers a wide variety of sizes, alloys, head and body types, all from stock.

Sizes: M3 up to M12

Alloys: aluminium, steel, stainless steel (A2)

Head types: cylindrical, countersunk, reduced countersunk

Body types: round, hexagonal, open and closed end

The diameters of the blind rivet nuts have been adapted to the use of standard drill diameters. The blind riveting bolt provides an external thread connection and is available in 4 different thread sizes with 4 different lengths each, serving an 8.8 strength class.

### Advantages

- Can be set in thin material easily.
- The time consuming tapping of a thread or welding of a blind rivet nut is no longer required.
- Blind rivet nuts have the same properties as a tapped thread in solid material, because of the strong 'flush flange' that remains after deformation of the rivet nuts.
- Can be set from one side when the rear of the material and the inside of the object are inaccessible.
- The material will not be damaged.
- Will not deform or cause discolouration of the material.

### FABORY hand tools for blind rivet nuts and bolts

The FABORY range of hand tools for blind rivet nuts and bolts, offers you one of the widest and most innovative ranges of professional riveting tools in the market.

All the FABORY blind insert hand tools are equipped with a (patented) quick release mandrel system enabling you to exchange mandrels with your bare hands without using additional spanners.

All tools are supplied in representative packaging with full sets of mandrels/adaptors and anvils.

FABORY's hand tools for blind rivet nuts and bolts are distinctive in a number of relevant areas

- Wide choice
- High professional quality
- Competitive price levels
- Continuous product development and innovations
- Complete supply of tools with full set of conversion kits and stroke regulation devices
- Quick-release system

### Quick-release mandrel system for blind rivet nut and bolt tools

1. Release the nosepiece and contra nut
2. Move protective sleeve forwards
3. Hold security part backwards and unscrew mandrel/adapter

## Jacknut

## AMECOIL Wire thread inserts

### Application

AMECOIL wire thread inserts are not only economical for recovering worn or damaged screw threads but also very suitable to achieve high-loadable internal thread in metal and non-metal materials. AMECOIL wire thread inserts can be used at temperatures from -40°C up to +400°C.

### Material

AMECOIL wire thread inserts are produced from a stainless steel A2 wire of diamond cross-section, that is wound in a coil like a spring.

### Threads

The internal screw thread of the nut-part of the AMECOIL wire thread insert is conforming to the normal tolerance field 6H. For details concerning the external screw thread in the material see DIN 8140-2.

### Assembly

For assembly of AMECOIL wire thread inserts see also the assembly sequence:

- drill the hole (do not countersink)
- tapping the thread with the special AMECOIL tap, the sizes of the thread of the special AMECOIL taps are larger than of a standard tap!
- screwing in the AMECOIL wire thread insert with AMECOIL manual fitting tool by 1/4 to 1/2 pitch under the surface of the part
- breaking-off the engaging stem of the AMECOIL wire thread insert up to  $\varnothing$  18 mm after fitting with the AMECOIL tang break, for sizes larger than M18 resp. 5/8 UNC/UNF a pointed plier has to be used
- assembly ready
- disassembly of a AMECOIL wire thread insert is possible with the special extractor.

3

- The prevailing torque type wire thread insert achieves its locking ability, between bolt and AMECOIL, by polygonal deformation of one or more spirals of the wire thread insert.
- They are painted red for easier identification with the standard type.

- Intended to use for breaking off the engaging stem after fitting of the wire thread insert.
- ATTENTION: for sizes larger than M18 resp. 5/8 UNC/UNF a pointed plier has to be used.

- Intended to use when an inserted wire thread insert has been poorly positioned and has to be extracted (metric / metric fine / UNC / UNF / BSW).
- ATTENTION: if the screwthread has not been damaged, a new wire thread insert can be fitted.

## FABORY Self-cutting threaded inserts

3

### General

The principle of the *FABORY* self-cutting threaded insert is quite simple. Not only "soft" materials i.e. aluminium, copper, brass, plastic and hardwood, but also metal with a tensile-strength of up to 420 N/mm<sup>2</sup> can easily be fitted with a reliable metric screw thread, and pretapping, is not necessary. Worn and damaged screw threads can now be quickly and easily repaired with a *FABORY* self-cutting threaded insert.

### Function

The *FABORY* self-cutting threaded insert uses an external thread to cut its way into the workpiece, and the metric internal thread offers an exceptional fixing with high-tensile values.

### Fitting

For fitting the *FABORY* self-tapping thread inserts, three handy tools are available:

- hand tool **type 610**
- hand/machine tool **type 620**
- hand/machine tool **type 6102**
  - exclusively suitable for the *FABORY* self-tapping thread inserts with a hexagon socket, **types 302 2** and **308 2**

For application in materials with a high tensile strength, we recommend:

- the use of a suitable lubricant, and/or
- pre-tapping with hand tap no. 1 (taper tap, marked with one ring)

### Types of thread insert

- **Type 302**, provided with two flutes and:
  - o in steel version, applicable in somewhat softer materials, with a tensile strength up to 300 N/mm<sup>2</sup>
  - o in stainless steel version, applicable in materials with a tensile strength up to 320 N/mm<sup>2</sup>
- **Type 307**, provided with three radial cutting holes, and applicable in somewhat harder materials, with a tensile strength from 360 to 420 N/mm<sup>2</sup>
- **Type 308**, same as type 307, but this type is the longer version of type 307
- **Type 302 2**, provided with two flutes, with hexagon socket, and applicable in somewhat softer materials with a tensile strength up to 300 N/mm<sup>2</sup>
- **Type 308 2**, provided with three radial cutting holes, with hexagon socket, long version, and applicable in somewhat harder materials, with a tensile strength from 360 to 420 N/mm<sup>2</sup>

Recommended hole diameters for problem-free fitting. For the other hole diameters, lubrication or pre-tapping may be necessary.

### Assembly sequence:

- 1) bore hole (see table above)
- 2) countersink hole (recommended)
- 3) screw insertion device into thread insert
- 4) screw thread insert in to approx. 0.1 to 0.2 mm below surface of workpiece
- 5) remove insertion device
- 6) component can be fitted

- For use in materials with tensile strength up to 300 N/mm<sup>2</sup>.
- Light metal alloys, cast iron, brass, bronze, non-ferrous metals, plastics and hardwoods.
- Advantages of the self-cutting thread inserts with hexagon socket:
  - Thread insert does not have to be screwed onto device: saves up to 50% of fitting time.
  - Simple insertion tool type 6102: use with tommy bar or optionally by machine.
  - Insertion device only needs to turn clockwise.
- Thread inserts are simple to unscrew (when recycling workpiece).

| <b>M12</b>      | 10,1 | 14 | 11  | 125 |

- s = Hex stud s (nom.).
- F = Shaft diameter F.
- G = Square G.
- B = Length B.

#### 71580 Self-tapping thread insert with hexagon socket tool type 6102

S94A

**Material**                    Steel  
**Packaging**                Standard

- Hand/machine tool 6102 is exclusively for use with self-tapping thread inserts with hexagon socket, types 302 2 and 308 2.
- Advantages of the self-tapping thread inserts with hexagon socket:
- Thread insert does not have to be screwed onto device: saves up to 50% of fitting time.
- Simple insertion tool type 6102: use with tommy bar or optionally by machine.
- Insertion device only needs to turn clockwise.
- Thread inserts are simple to unscrew (when recycling workpiece).

## FABORY Self-cutting threaded inserts

### Fitting tip

For fitting the *FABORY* self-tapping thread inserts, the three handy tools mentioned earlier are available, namely:

- *FABORY* self-tapping thread inserts with hexagon socket **types 302 2** and **308 2** can be fitted with hand/machine tool **type 6102**
- hand tool **type 610**
- hand/machine tool **type 620**

Both suitable for the *FABORY* self-tapping thread inserts WITHOUT hexagon socket: types 302, 307 and 308.

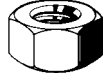

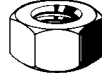

For emergency or rapid fitting of only a few of these types of *FABORY* self-tapping thread inserts, it is also possible to use a nut and bolt of correct size.

*FABORY* self-tapping thread inserts of type 302 are also available in a selection case (S572). 420 items in total, in sizes from M3 up to M16, in materials steel, zinc plated yellow passivated and some sizes in C4 stainless steel (art. no. 41010.000.572).

- For hot dip galvanized threaded rods with OVERSIZED thread the zinc layer is applied ON the normal thread, so AFTER galvanizing these threaded rods are no longer ISO-metric mating, but thicker: so called OVERSIZED.
- They do not mate the usual fit of screwthread and cannot be used in e.g. normal threaded holes.
- The corresponding OVERSIZED nuts have been tapped about 0,3 mm larger AFTER galvanizing running perfectly onto these threaded rods.

- For hot dip galvanized threaded rods with ISO-METRIC FITTING thread, the thread is rolled undersize so that it will meet the go-gauge with tolerance class h AFTER galvanizing.
- The advantage of this way of manufacturing is that the threaded rods can be used in any threaded hole without any problem.
- The corresponding ISO-METRIC FITTING nuts have been threaded according to the tolerance class 6H AFTER galvanizing so that they perfectly fit onto the threaded rods.

- For hot dip galvanized threaded rods with ISO-METRIC FITTING thread, the thread is rolled undersize so that it will meet the go-gauge with tolerance class h AFTER galvanizing.
- The advantage of this way of manufacturing is that the threaded rods can be used in any threaded hole without any problem.
- The corresponding ISO-METRIC FITTING nuts have been threaded according to the tolerance class 6H AFTER galvanizing so that they perfectly fit onto the threaded rods.

- For hot dip galvanized threaded rods with OVERSIZED thread the zinc layer is applied ON the normal thread, so AFTER galvanizing these threaded rods are no longer ISO-metric mating, but thicker: so called OVERSIZED.
- They do not mate the usual fit of screwthread and cannot be used in e.g. normal threaded holes.
- The corresponding OVERSIZED nuts have been tapped about 0,3 mm larger AFTER galvanizing running perfectly onto these threaded rods.

## Threaded rod MF

DIN 976-1A  
 NEN 2369  
 NF E25-136

The end of the threaded rod is painted to improve the recognisability of the quality.

- Special features PERMAGLAS:
- Glass-fiber reinforced epoxy
- Temperature resistant  $-270^{\circ}\text{C}$  up to  $+155^{\circ}\text{C}$
- Light weight (gravity 1,8)
- Corrosion resistant
- Resistant to aggressive chemicals and gases
- Electrical- and thermal insulated
- Non-magnetic
- Higher mechanical properties as f.i. Polyamid

| M20 | 2,5  | 25                  | 46                         | 52  | 6,3   | 55  |
| M22 | 2,5  | 28                  | 50                         | 56  | 6,3   | 60  |
| M24 | 3    | 30                  | 54                         | 60  | 7,5   | 65  |
| M27 | 3    | 35                  | 60                         | 66  | 7,5   | 70  |

- ATTENTION: when ordering studs acc. to DIN the diameter  $d$  x the effective length  $L$  has to be stated e.g. stud M10 x 65 - DIN 939, where  $L = 65$  mm is the working length and  $b_1 = 12$  mm the metal end. The total length is  $65 + 12 = 77$  mm. The threadlength on the outside  $b_2 = 26$  mm.
- The screw-in threaded end has been made with tolerance Sk6, acc. to DIN 13-51, meaning "heavy fit", and prevents loosening of studs during disassembly.
- Studs acc. to DIN 939 (5.6/5.8/8.8) with a metal end  $\approx 1,25d$  have many applications, among others in cast-iron.

## Stud metal end $\approx 1,25d$ BSW

DIN  $\approx 939$  (1955)  
NEN  $\approx 2346$  (1962)

### Technical data

| d     | Threads per inch | b     | e $\approx 1,25d$ |
|-------|------------------|-------|-------------------|
| 5/16  | 18               | 18    | 10                |
| 3/8   | 16               | 20    | 12                |
| 1/2   | 12               | 25/30 | 16                |
| 5/8   | 11               | 28    | 20                |
| 3/4   | 10               | 32    | 25                |
| 1.IN. | 8                | 40/55 | 35                |

- Whitworth thread (BSW) is not internationally recommended.
- It is advised to use metric (M).
- ATTENTION: when ordering studs according to DIN the diameter  $d \times$  the effective length  $L$  has to be stated e.g. stud 5/16 x 25, where  $L = 25$  mm is the working length and  $e$  10 mm the metal end.
- The total length is  $25 + 10 = 35$  mm.
- The threadlength on the outside  $b = 18$  mm.
- Studs acc. to  $\approx$  DIN 939 (1955) with a metal end  $e \approx 1,25 d$  have many applications, among others in cast-iron.
- The screw-in threaded end has been made with tolerance Sk6, acc. to DIN 13 and 14, Beiblatt 14 (1944), meaning "heavy fit", and prevents loosening of studs during disassembly.

| M30 | 3,5  | 30               | 66    | 9,0   | 80                                       |

- ATTENTION: when ordering studs acc. to DIN the diameter  $d$  x the effective length  $L$  has to be stated e.g. stud M10 x 70 - DIN 938, where  $L = 70$  mm is the working length and  $b_1 = 10$  mm the metal end. The total length is  $70 + 10 = 80$  mm. The thread length on the outside  $b_2 = 26$  mm.
- The screw-in threaded end has been made with tolerance Sk6, acc. to DIN 13-51, meaning "heavy fit", and prevents loosening of studs during disassembly.
- Studs acc. to DIN 938 with a metal end  $\approx 1d$  have many applications, among others in steel.

## Studbolts - threaded rods - heavy hexagon nuts for the petrochemical- and off shore industry

### Grades

For studbolts and threaded rods Grade B7 acc. to ASTM A193 is the most popular Grade. Also ferritic steel Grade B16 acc. to ASTM A193 (for higher temperatures), Grade L7 acc. to ASTM A320 (for lower temperatures) and austenetic stainless steel Grade B8, B8M and B8T acc. to ASTM A193 (applicable for a very wide temperature range), can be supplied. For the matching heavy hex. nuts is Grade 2H acc. to ASTM A194 the most popular Grade. Also ferritic steel Grade 4 and Grade 7 acc. to ASTM A194 and austenetic stainless steel Grade B8, B8M and B8T acc. to ASTM A194 can be supplied ex-stock.

### Mechanical properties

ASTM A193 Grade B8, B8M en B8T comply with Class 1. Class 2 can be supplied on request. The mechanical properties mentioned below of ASTM A193 Grade B7 and B16 as well as ASTM A320 Grade L7, apply to diameters of 2 1/2 inch or 65 mm.

### Temperature range

Recommended max. operating temperature acc. to BS 4882: Grade B7 and L7 = 400°C / Grade B16 = 525°C / Grade B8, B8M and B8T = 575°C.

The cold-resistant steel A320 Grade L7 complies with a min. impact value of 20J at -101°C (average min. 27J).

### Certificates

Occasionally with the delivery of studbolts and heavy hex nuts a 3.1 certificate acc. to EN 10204 (DIN 50049) is required.

### Specials

Studbolts and heavy hex nuts with a corrosion resistant surface treatment such as zinc plated, hot dip galvanised, Xylan 1070 (PTFE coating), zinc flake (f.i. Dacromet 500) etc. can be supplied on request. Even less usual materials such as Duplex ASTM A453 Grade 660, Monel etc. can be supplied on request.

### Studbolts and threaded bolts

## Double end studs

### with reduced shank with 2 hexagon nuts

#### Material quality

Low temperature resistant, high temperature resistant, high-pressure hydrogenation, corrosion resistant and non magnetizable (permeability 1,05G/Oe).

#### High requirements

By means of annealed, normalized, carbide-solution, quenched and tempered, warm-cold formed and precipitation hardened.

#### Quality

Double end studs are manufactured by approval of TÜV and also acc. to AD regulation WO and TRD sheet 100. When ordering double end studs please mention always the material code (see markingsigns tabel below), the associated hexagon nuts are supplied seperately. The packaging and packinglist are only mentioned by the materialnumber of the bolts. For applications and calculations of double end studs at pressure vessels see AD-Merkblatt B7 from "Arbeitsgemeinschaft Druckbehälter".

#### Application

Double end studs are generally applied in the stringent construction sectors like nuclear reactors and -technology, turbines, boilers, high-pressure tanks, high-capacity chemical vessels, chemical apparatus, shipbuilding, oil industry, petrochemistry, refrigeration plants, pipelines, instruments, motor construction and offshore technics.

#### Certificates

Upon special request the inspection certificates 3.1 and 3.2 can be delivered acc. to EN 10204 (DIN 50049).

#### Operating temperature ranges and bolt/nut combinations

<sup>1</sup> Material properties of double end studs with reduced shank and nuts acc. to DIN 267-13 and DIN 17240.

<sup>2</sup> For hexagon nuts the usual limit of the temperature used in continous operation can be 50C higher.

<sup>3</sup> Deviating from DIN 17240, higher temperatures are admissible for piping acc. to DIN 2507.

## Double end stud with reduced shank with 2 hexagon nuts

DIN 2510 L/NF

- If lifting eye bolts form part of lifting equipment, CE marking is necessary.
- Lifting eye bolt do not require CE marking if not used for lifting (as towing eyes for example) or is only used once for lifting (such as for moving machines).

## Lifting eye bolt non-metric

DIN ≈580 (1957)  
NEN ≈2347 (1960)

### Technical data

| d1    | Threads per inch | d2  | d3  | d4 | h   | L  |
|-------|------------------|-----|-----|----|-----|----|
| 5/16  | 18               | 20  | 36  | 20 | 36  | 13 |
| 3/8   | 16               | 25  | 45  | 25 | 45  | 17 |
| 1/2   | 12               | 30  | 54  | 30 | 53  | 22 |
| 5/8   | 11               | 35  | 63  | 35 | 62  | 27 |
| 3/4   | 10               | 40  | 72  | 40 | 71  | 30 |
| 7/8   | 9                | 45  | 81  | 45 | 81  | 35 |
| 1.IN. | 8                | 50  | 90  | 50 | 90  | 36 |
| 1.1/4 | 7                | 65  | 108 | 60 | 109 | 45 |
| 1.1/2 | 6                | 75  | 126 | 70 | 128 | 55 |
| 1.3/4 | 5                | 100 | 166 | 90 | 168 | 70 |
| 2.IN. | 4,5              | 100 | 166 | 90 | 168 | 70 |

- Whitworth thread (BSW) is not internationally recommended. It is advised to use metric (M).
- C15 material has been standardised and has a minimum impact strength of 80 Joule (ISO-testpiece) resp. 90 Joule (DIN-testpiece).

| M72x6      | 6    | 150 | 260 | 140 | 260 |

- If lifting eye nuts form part of lifting equipment, CE marking is necessary.
- Lifting eye nuts do not require CE marking if not used for lifting (as towing eyes for example).

## Safety swing hook

### Technical data

| d   | b  |
|-----|----|
| 8,8 | 50 |
| 10  | 45 |
| 12  | 55 |

### Assembly data

5

- safety swing hook must be turned in sufficiently so that the threaded shank is completely **invisible**
- safety swing hook must be **transversely** assembled to the swingdirection (this causes the ring to roll and not to slide, consequently reducing wear to minimum)
- safety swing hook and ring must be greased regularly!
- extensive assembly data in each packaging of these safety swing hooks
