- Special features of threaded rods for shuttering:
- Are poured in concrete without using plastic sleeves or similar.
- After starching of the concrete the threaded rod can be loosened by hammering and turned out.
- Concrete does not adhere well on the threaded profile, so cleaning of the rods is not necessary and they can be re-used.
- The mortar to cover the hole afterwards attaches very well (contra-profile of the thread in the concrete).

## VEMO Concrete inserts

### General

VEMO concrete inserts are used in the concrete element industry not only for handling, lifting, transporting of fixing/joining of prefab elements, but also for constructional- and fixing purposes. The VEMO reinforced bar coupling system is unique as there is no loss of crosssection.

### Assembly

When the inserts have been embedded in the concrete in such a way, that the exposed threaded end lies beneath the concrete surfaceline, then the use of a protective cap is necessary.

### Mechanical properties

The giving values on the following pages are based on the admissible static load, purely pull-out or shearing load. They are calculated by applying of a safety-coefficient of  $V = 4 - 5$  to the average breaking-load in concrete with a specific compression strenght of 22,5 N/mm. The given values for loads are guidelines.

### Calculation

For a combination of a pull-out load (N) and a shearing load (T) the following formula may be used:  $F_{\text{admissible}} = \sqrt{N^2 + T^2}$ . If using VEMO concrete inserts the following guidelines have to be observed, for

constructional inserts the distance between eachother has to be bigger than  $10xd$  (being the threaddiameter of the insert). The distance between the insert and the edge of the concrete has to be bigger than  $5xd$ .

### Specifications

Many considerations, such as the strenght and the age of the concrete, reinforcement details, as well as the circumstances under which the inserts are loaded, are factors, which can influence considerably the carrying capacity (see f.i. specifications of Dutch standard-NEN 3880, VB-C-717.4, Dutch "Arbeidsinspectie", etc.)

### Specials

On request available with hot dip galvanized treatment, the stainless steel qualities of the concrete inserts are AISI 303 and 304 (V2A), this material, known as 18-8 steel, gives an excellent resistance against corrosion; and AISI 316 Ti, this material is stabilized with molybdenum and titanium. It carries a high resistance against tension and inter-crystalline corrosion. The material is used in high concentration of chlorides and/of high temperature areas.

### Quality

All VEMO concrete inserts are tested by the Dutch TNO - IBBC. Barconnectors No. 1550 and bushes No. 1551 are acc. to conditions in VB-C-717.1.2

8

Fixing of roof slated at concrete floors

Fixing of railings on balconies

For anchoring in READY concrete see LIEBIG, SPIT and FISCHER anchors and expanding bolts elsewhere in this section. Further technical data available on request.

- Taper pins are designed for the friction type fastening and/or locking together of two or more individual elements. The tapered shape allows the connection to be disconnected repeatedly, and when the elements are joined together again, their location remains as accurate as it was previously, and the frictional connection remains as strong as before.
- The nominal length (L) does not include the rounded ends (tolerance js15).

## Parallel pin (dowel pin)

ISO 2338  
 DIN 7  
 NEN 2281  
 BS 1804-2

### Technical data

| d1 (m6) | c (max.) | d1 (m6) | c (max.) | d1 (m6) | c (max.) |
|---------|----------|---------|----------|---------|----------|
| 1       | 0,15     | 4       | 0,6      | 12      | 1,8      |
| 1,5     | 0,23     | 5       | 0,75     | 14      | 2        |
| 2       | 0,3      | 6       | 0,9      | 16      | 2,5      |
| 2,5     | 0,4      | 8       | 1,2      |         |          |
| 3       | 0,45     | 10      | 1,5      |         |          |

- Parallel pins are designed for the fastening of two or more individual elements. A friction type connection can be achieved by the selection of suitable fits. If such connection is meant to be disconnected repeatedly, then it becomes preferable to use taper pins in accordance with DIN 1.
- d x L: The nominal length (L) does not include the rounded ends.

## Parallel pin (dowel pin) hardened tolerance zone m6

ISO 8734 A  
 DIN 6325  
 NEN 2282  
 NF E27-475

- Parallel pins are used mainly as dowels for tools, clamping devices and measuring devices.
- The nominal length ( $L_1$ ) is inclusive the rounded ends (tolerance js14).

## Parallel pin (dowel pin) hardened tolerance zone h6

ISO ≈8734 A  
 DIN ≈6325  
 NEN ≈2282  
 NF ≈E27-475

- Parallel pins are used mainly as dowels for tools, clamping devices and measuring devices.
- $d \times L_1$ : The nominal length ( $L_1$ ) is inclusive the rounded ends (tolerance js14).

## Grooved pin, full length parallel grooved with pilot

ISO 8739  
DIN 1470  
NEN 2601

### Technical data

| d1  | Tolerance | c ≈  | V    |
|-----|-----------|------|------|
| 1,5 | h9        | 0,2  | 1,6  |
| 2   | h9        | 0,25 | 2,85 |
| 2,5 | h9        | 0,3  | 4,25 |
| 3   | h9        | 0,4  | 6,15 |
| 4   | h11       | 0,5  | 10,6 |
| 5   | h11       | 0,6  | 16,5 |
| 6   | h11       | 0,8  | 22,8 |
| 8   | h11       | 1    | 40,5 |

- V = Shear strength double min. in kN.
- For the hole diameter  $d_1$ (nom.) with tolerance field H11 is recommended.
- The nominal length (L) does not include the rounded ends (tolerance js15).

### Examples of application

### 39700 Grooved pin, full length parallel grooved with pilot

L11F

**Material** Free-cutting steel

## Grooved pin, full length parallel grooved with chamfer

ISO 8740  
 DIN 1473  
 NEN 2604

### Technical data

| d1  | Tolerance | c ≈  | V    |
|-----|-----------|------|------|
| 1,5 | h9        | 0,2  | 1,6  |
| 2   | h9        | 0,25 | 2,85 |
| 2,5 | h9        | 0,3  | 4,25 |
| 3   | h9        | 0,4  | 6,15 |
| 4   | h11       | 0,4  | 10,6 |
| 5   | h11       | 0,6  | 16,5 |
| 6   | h11       | 0,8  | 22,8 |
| 8   | h11       | 1    | 40,5 |

- V = Shear strength double min. in kN.
- For the hole diameter  $d_1$ (nom.) with tolerance field H11 is recommended.
- The nominal length (L) does not include the rounded ends (tolerance js15).

## Grooved pin, half length reverse grooved

ISO 8741  
DIN 1474  
NEN 2605

### Technical data

| d1  | Tolerance | c ≈  | V    |
|-----|-----------|------|------|
| 1,5 | h9        | 0,2  | 1,6  |
| 2   | h9        | 0,25 | 2,85 |
| 2,5 | h9        | 0,3  | 4,25 |
| 3   | h9        | 0,4  | 6,15 |
| 4   | h11       | 0,5  | 10,6 |
| 5   | h11       | 0,63 | 16,5 |
| 6   | h11       | 0,8  | 22,8 |
| 8   | h11       | 1    | 40,5 |

- V = Shear strength double min. in kN.
- For the hole diameter  $d_1$ (nom.) with tolerance field H11 is recommended.
- The nominal length (L) does not include the rounded ends (tolerance js15).

## Grooved pin, third length center grooved

ISO 8742  
 DIN 1475  
 NEN 2606

### Technical data

| d1  | Tolerance | c ≈  | V    |
|-----|-----------|------|------|
| 1,5 | h9        | 0,2  | 1,6  |
| 2   | h9        | 0,25 | 2,85 |
| 2,5 | h9        | 0,3  | 4,25 |
| 3   | h11       | 0,4  | 6,15 |
| 4   | h11       | 0,5  | 10,6 |
| 5   | h11       | 0,6  | 16,5 |
| 6   | h11       | 0,8  | 22,8 |
| 8   | h11       | 1    | 40,5 |

- V = Shear strength double min. in kN.
- For the hole diameter  $d_1$ (nom.) with tolerance field H11 is recommended.
- The nominal length (L) does not include the rounded ends (tolerance js15).

### Examples of application

### 39750 Grooved pin, third length center grooved

L11F

**Material** Free-cutting steel  
**Packaging** Standard

| 16       | 16,45                 | 17                    | 15,6           | 4   | 155  |

- V = Shear strength double min. in kN.
- Special features of spring-type straight pins (spiral pins):
- Are used for the dismantable connection (positioning) of two or more parts and can also be applied as shafts and hinge-, stop- or carrierpins.
- Due to the spiral shaped cross section (approx. 2.1/4 coils) the spring-type straight pins (spiral pins) are very flexible and suitable to be used more times for dynamic loads. Equal stress distribution throughout its cross section against the hole wall produces a good press fit, which can absorb shear forces unaffected by the direction.
- Swaged chamfer at both ends, so they can easily be inserted and installed automatically.
- For the hole diameter d (nom.) the tolerance H12 is recommended except for d (nom.)1mm, the tolerance H10 is recommended.

### Examples of application

### 39140 Spring-type straight pin (spiral pin) coiled, standard duty

L09A

**Material** Spring steel 420-560 HV30  
**Packaging** Standard

| 8        | 8,3                   | 8,63                  | 7,8            | 2   | 30   |

- V = Shear strength double min. in kN.
- Special features of spring-type straight pins (spiral pins):
- Are used for the dismantlable connection (positioning) of two or more parts and can also be applied as shafts and hinge-, stop- or carrierpins.
- Due to the spiral shaped cross section (approx. 2.1/4 coils) the spring-type straight pins (spiral pins) are very flexible and suitable to be used more times for dynamic loads.
- Equal stress distribution throughout its cross section against the hole wall produces a good press fit, which can absorb shear forces unaffected by the direction.
- Swaged chamfer at both ends, so they can easily be inserted and installed automatically.
- The austenetic steel type is at the manufacturer's discretion, and can vary from the steel types stated in DIN 267-11.
- For the hole diameter d (nom.) with tolerance H12 is recommended except for d (nom.) 1mm the tolerance H10 is recommended.

| 6        | 6,18                  | 6,4                   | 5,85           | 1,5 | 30   |

- V = Shear strength double min. in kN.
- Special features of spring-type straight pins (spiral pins):
- Are used for the dismantable connection (positioning) of two or more parts and can also be applied as shafts and hinge-, stop- or carrierpins.
- Due to the spiral shaped cross section (approx. 2. 1/4 coils) the spring-type straight pins (spiral pins) are very flexible and suitable to be used more times for dynamic loads. Equal stress distribution throughout its cross section against the hole wall produces a good press fit, which can.
- Absorb shear forces unaffected by the direction.
- Swaged chamfer at both ends, so they can easily be inserted and installed automatically.
- For the hole diameter d (nom.) the tolerance H12 is recommended except for d (nom.)1mm, the tolerance H10 is recommended.

### 39150 Spring-type straight pin (spiral pin) coiled, heavy duty

L09A

**Material** Spring steel 420-560 HV30  
**Packaging** Standard

- V = Shear strength double min. in kN.
- For the hole diameter d(nom.) with tolerance field H12 is recommended.

Special features spring-type straight pins:

- are used to connect two or more construction elements to each other
- highly suitable to absorb shear forces
- to avoid movements in light bolt connections spring-type straight pins can be used accordingly to information stated below:

| d (nom.) spring-type straight pin   | 6   | 8   | 10  | 12  | 16  | 18   |
|-------------------------------------|-----|-----|-----|-----|-----|------|
| intended for bolt size              | M3  | M4  | M5  | M6  | M8  | M10  |
| associated washers acc. to DIN 7349 | 3,2 | 4,3 | 5,3 | 6,4 | 8,4 | 10,5 |

### 39100 Spring-type straight pin slotted, heavy duty

L09A

**Material** Spring steel 420-560 HV30  
**Packaging** Standard

9

- V = Shear strength double min. in kN.
- For the hole diameter d(nom.) with tolerance field H12 is recommended.
- a: pins over 10mm have a single bevelled edge.

Special features spring type straight pins:

- are used to connect two or more construction elements to each other
- highly suitable to absorb shear forces
- to avoid movements in light bolt connections spring type straight pins can be used acc. to information below

| d (nom.) spring type straight pin slotted | 6   | 7   | 8   | 11  | 13   | 16  | 18  |

- V-1 = Shear strength single min. in kN.
- V-2 = Shear strength double min. in kN.
- The austenetic steel type is at the manufacturer's discretion, and can vary from the steel types stated in DIN 267-11.
- For the hole diameter d(nom.) with tolerance field H12 is recommended.
- a: Bevelled edges of 30° on both sides for sizes up to and including 6mm, pins over 6mm have a single bevelled edge of 15°.

Special features spring-type straight pins:

- are used to connect two or more construction elements to each other
- highly suitable to absorb shear forces
- to avoid movements in light bolt connections, spring-type straight pins can be used according to information stated below:

| d (nom.) spring-type straight pin slotted | 6   | 8   | 10  | 12  | 16  | 18   |
|---|-----|-----|-----|-----|-----|------|
| intended for bolt size                    | M3  | M4  | M5  | M6  | M8  | M10  |
| associated washers acc. to DIN 7349       | 3,2 | 4,3 | 5,3 | 6,4 | 8,4 | 10,5 |

### 51428 Spring-type straight pin heavy type A2

- For the split pin hole, tolerance H13 is recommended for d (nom.) ≤ 1,2 mm and tolerance H14 for d (nom.) ≥ 1,6 mm and above.
- Shape of the split pin ends at the manufacturer's discretion.
- The nominal length (L) is with tolerance js17.

### Table-choice of split pins

| d (nom.) |                        | 1           | 1,6 | 2   | 2,5 | 3,2 | 4  | 5  | 6,3 | 8  | 10 | 13 |     |
|----------|------------------------|-------------|-----|-----|-----|-----|----|----|-----|----|----|----|-----|
| d2       | parts with thread*     | above       | 3,5 | 5,5 | 7   | 9   | 11 | 14 | 20  | 27 | 39 | 56 | 80  |
|          |                        | up to incl. | 4,5 | 7   | 9   | 11  | 14 | 20 | 27  | 39 | 56 | 80 | 120 |
|          | parts without thread** | above       | 3   | 5   | 6   | 8   | 9  | 12 | 17  | 23 | 29 | 44 | 69  |
|          |                        | up to incl. | 4   | 6   | 8   | 9   | 12 | 17 | 23  | 29 | 44 | 69 | 110 |
| v        | min.                   | 4           | 5   | 6   | 6   | 8   | 8  | 10 | 12  | 14 | 16 | 20 |     |

\* For application in parts with external thread the major diameter of the thread or the diameter of the plain part has to be used.

\*\* For railways and constructions subjected to alternating transverse forces, it is recommended to use the following larger split pin size.

The hole distance W depends on the construction part in which the split pin is inserted. If necessary see the standard of that particular part.

### Assembly data

For the hole diameter, d1 (nom.) with tolerance field H13 is recommended.

It is also recommended to connect the spring cotter of a bolt with the unit to be locked so that it cannot be lost.

## Bright key steel length 1 meter

DIN 6880

- Bright key steel is cold drawn with a rather smooth and bright surface and corresponding to a high accuracy of dimensions. Usable for the manufacturing of parallel keys and taper keys with gip head.
- For b is the tolerance h9 and for h tolerance h11 (except the size 12 x 8 and square key steel having for b as well as h tolerance h9).

- (1.) Application is valid for keys, which are used as a fitting key transmitting the whole turning moment.
- (2.) Application is valid for keys, which are used only for the positioning of the driving element, while for the transmission of the turning moment other articles e.g. parallel keys or taper pins are used.

## FABORY blind rivets

The technology of blind riveting is simple. The materials to be riveted have to be accessible from one side only. This explains the term 'blind'.

The rivet consists of two parts: the body and the mandrel. The body is deformed when the rivet is set and this deforming is what clamps the materials together. The mandrel is the part that deforms the body of the rivet. This part is stronger than the body. The mandrel breaks off at its own specific breaking point. This breaking point ensures that the mandrel breaks off at the exact right moment, so the body is deformed and the materials are clamped together correctly.

### Tools

Complementary to the blind rivet fastener range, a series of hand and power tools is available. There are tools for small and light assembly work as well as for heavy duty purposes.

### Five main groups

The FABORY range of blind rivets consists of five main groups:

**OMNI:** standard open rivets

**PLUS:** open rivets with a longer break point

**MULTI:** open rivets with a large grip range

**SIGMA:** closed end rivets

**SPECIALS:** special rivets for application in soft materials (EXPO, TRIPO, HAMMER)

### FABORY OMNI

FABORY's OMNI label represents the product range of standard open blind rivets. The FABORY OMNI rivet is a rivet for general use, with the mandrel breaking point placed just below the head.

### FABORY PLUS

Typical of the FABORY PLUS and PLUS BULB product ranges is the long captive mandrel that remains in the rivet shaft when the mandrel has reached its predetermined breaking point. This provides additional shear strength, equal to that of a solid rivet.

The PLUS BULB has a higher clamping force on the components. The rivet is vibration proof, and the mandrel is secured against falling out. Moreover, it is splash and drip proof.

### FABORY MULTI

FABORY's MULTI rivet is a multi-grip rivet with a larger clamping range. This can help achieve a significant reduction of stock. The MULTI rivets can be used for general purposes. A large bulb is formed at the back of the rivet, spreading the clamping load to a wide area. After setting, the mandrel remains in the rivet and makes it vibration resistant. Due to the rivet's structural features, it has a good capacity to fill the pre-drilled hole and is dust and splash proof.

### FABORY SIGMA

The FABORY SIGMA range offers closed end rivets that have been especially developed to combine a strong fixation with a water or air proof seal. During setting, the rivet body expands to fill the hole, enabling the rivet to withstand pressures up to 35 bar (3500 kPa). The mandrel head is 100% retained, providing high resistance to vibration. The result is a rivet connection with higher tensile and shear strengths. To ensure optimal setting of the closed end rivets, it is important that the pre-drilled hole has the correct size.

### FABORY SPECIALS

In addition to the standard ranges of blind rivets, FABORY offers the supply of many other types of blind rivets for specific applications from stock: the FABORY SPECIALS. For application in soft materials.

- EXPO Peel rivets
- TRIPO rivets
- HAMMER rivets

## Domed head blind rivet

- S = Static load in kN (max.).
- The combination of a spherical washer type C with a conical seat type D enables a swing of  $\approx 3^\circ$  in any direction to be attained, when positioning a bolt through.
- ATTENTION: when these washers are applied in combination with fasteners class 10.9 or 10, the allowable clamping load will be at maximum 46% of  $R_e$ ; for class 8.8 or 8 at maximum 66% of  $R_e$ .
- These washers cannot be applied on slotted holes.

## LINDAPTER System of fixings

**lindapter**  
LINDAPTER S.p.A.

### General

The LINDAPTER-system of fixings comprises various types of steelwork fixings (type A to D2). In combination with standard fasteners, like hexagon bolts, hexagon head wood screws, property classes 4.6 or 8.8, rigid connections can efficiently be made from steel on steel, steel on wood, steel on concrete, etc.

### Attention

For high friction clamps type **AF**, for applications where high frictional loads are encountered, see elsewhere in this section.

### Principle

The LINDAPTER steelwork fixing has been provided with a supporting tail available in 3 heights: short, medium and long, which should be chosen to suit thickness of flange to be gripped. A further increase of the clamping range is possible by using packings (type P and CW), which also are available in various heights and can mutually be combined (height of tail + height of packings = flange thickness  $\pm$  1 mm).

### Applications

One of the most important applications of the LINDAPTER-system of fixings is the girder clamp for securing secondary steelwork to structural members.

### Advantages:

- all components available off the shelf and universally applicable
- no need for special fasteners
- no site drilling or welding necessary, ideal solution when drilling or welding is not allowed
- steelwork is not weakened
- versatile and simplified assembly
- no fitting and aligning work
- eliminates remedial work necessary due to adjustments
- the connection can be disassembled
- steelwork and protective coating are not damaged and can be re-used
- considerable cuts of installation time and labour costs especially on difficult and hazardous sites

### Technical data

For further technical data on sizes, loads, examples of application and assembly sequences, an extensive LINDAPTER brochure is available on request. For fixing hanging elements on steel structures, see *FABORY FASTCLIP*, see elsewhere in this catalogue.

- A Hollo-bolt is simply inserted, through fixture and steelwork (cone end first), in a pre-drilled hole. Grip the Hollo-bolt collar with an open-ended spanner. Using a torque wrench, tighten the hexagonal bolt to the torque given by the table above.
- Allowable shear load. Application under dynamic load needs to be fixed carefully.
- The recommended tightening torque creates a limited clamping load in the assembly, the connection may **not** be compared with a regular bolt/nut assembly.
- For further technical data on sizes, loads, examples of application and assembly sequences, an extensive LINDAPTER brochure is available on request.

| Max. load in kN (5:1)          | 30     |
| Tightening torque in Nm        | 147    |

- FLUSH CLAMP is an adjustable steelwork connection that clamps the flanges of two steel beams together without the use of a location plate. This assembly forms a clamp that is suitable for connecting beams of varying flange widths and thicknesses.
- Contents FLUSH CLAMP set: 4 each of six basic components: special body, special bolts, special washers, flat washers, hexagon nuts and half nuts.
- Technical brochure available on request.

| <b>Assembly data</b>         |             |
| Total clamping thickness     | 38-43-48    |
| Clamping force par clip in N | 340-530-680 |

- The GF 3030 is a groundbreaking product that enables the connection of European style 30 x 30 floor grating to steel sections.
- The product's ingenuity lies in its place and stand installation method, which can be carried out by one person only, working from above, without the need to drill or weld.
- Not only does this significant cost savings, but maintains the integrity of existing steelwork.
- The GF 3030 is designed specifically for use with 30 mm depth floor grating. It is however possible to use the product on other grating depths, providing the total fixing thickness (grating depth + steelwork flange thickness) is between 38 mm (minimum) and 48 mm (maximum). The steelwork flange thickness range is 8-18 mm.
- Sheradized acc. to BS 4921 Class 1 (380°C max.) plus passivation and one coat of silver Delta Seal.
- Technical brochure available on request.

- One-piece hinged pipe clamp with patented rapid locking and readjusting mechanism.
- Sound insulation for DIN 4109.
- Advantages / Benefits.
- Quick-connect permits a simple and fast installation with one hand.
- Hinged pipe clamp can open wide for easy insertion of the pipe.
- Time and energy saving insertion of the pipe in overhead installation.
- For fastening:
- Pipe lines to walls, ceilings and floors in the sanitary and heating area.
- Properties:
- Material: Steel DD11 (material no. 1.0332) acc. to DIN EN 10111.
- Zinc plating :Electro zinc plated, 5 - 9 µm.
- Connecting nut (FGRS Plus): Resistance welded, M 8, SW 13.
- Locking screw (FGRS Plus): Flat head screw with combination recessed head.
- Sound insulation insert: Material: SBR/EPDM; chlorine-free; silicone-free.
- Sound insulation for: DIN 4109.
- Temperature range: -50° to +110°C.
- Hardness: 45 +/- 5° Shore.
- Fire behavior: DIN 4102: class B2.

- Two-piece pipe clamp with patented rapid locking and readjusting mechanism.
- Sound insulation for DIN 4109.
- Connecting nut with combination thread M8 / M10.
- Advantages / Benefits
- Quick-connect permits simple and fast installation.
- Large opening angle for easy insertion of the pipes.
- Because of reliable click mechanism, the pipe can be preinstalled and adjusted easily.
- Time and energy saving insertion of the pipes for overhead installation.
- For fastening pipe lines, such as heating, sanitary and waste water pipes, to walls, ceilings and floors.
- Properties:
- Material: Steel DD11 (material no. 1.0332) acc. to DIN EN 10111.
- Zinc plating: Electro zinc plated, 5 - 9 µm.
- Connecting nut: Resistance welded, M 8/M 10, SW 13.
- Locking screw: Flat head screw with combination recessed head.
- Sound insulation insert: Material: SBR/EPDM; chlorine-free; silicone-free.
- Sound insulation for DIN 4109.
- Temperature range: -50° to +110°C.
- Hardness: 45 +- 5° Shore.
- Fire behavior: DIN 4102: class B2.

- Two-piece pipe clamp with PU hard foam shell.
- Insulation with self-adhesive seal.
- Advantages / Benefits:
- PU insulation element for high insulating effect.
- Compression-resistant PU hard foam for load absorption.
- Steam diffusion-tight due to Alu outer shroud.
- High aging resistance.
- Step-shaped sealing joints on the insulation for better sealing.
- Simple installation due to large opening angle.
- Locking screw with large combination recessed head is secured against loss.
- For fastening:
- Pipes in refrigeration and air conditioning technology with PU insulation.
- Properties:
- Material closed-cell polyurethane foam.
- Diffusion resistance 2500 K.
- Density 80 kg/m<sup>3</sup>.
- Compressive strength 0.6 N/mm<sup>2</sup>.
- Heat conductivity (at 0°C) 0.030 W/(m\*K).
- Locking screw: Flat head screw with combination recessed head.
- Temperature range - 40 °C to + 80 °C.
- Fire behavior: DIN 4102: class B2.

- Channel as C profile for the save installation of fastenings can be horizontally and vertically adjusted.
- Fast and streamlined fastening of pipe tracks and load-bearing constructions.
- Advantages / Benefits:
  - High bending and pull-out strength due to optimized profile cross section.
  - High flexibility due to different hole geometries.
  - Versatile options for wall, floor and ceiling installation.
  - Specially synchronised connection parts allow for assembly of simple, safe and versatile load bearing constructions.
  - Simple cutting and installation due to stamped grid dimensions on the rail side.
- For fastening:
  - Pipe tracks and pipe lines.
  - Ventilation ducts.
- Material: Steel DX51D+Z 275 NA-C (material no. 1.0226+Z) acc. to DIN EN 10327.
- Zinc plating: Sendzimir zinc plated, approx. 20 µm.

- Channels as C profile with a welded base plate.
- Mainly for pipe mounting directly on the wall but also for fastenings and structures on the ceiling and in the floor area.
- ALK Q with base plate welded on laterally.
- Advantages / Benefits:
- Fast and simple installation of pipe lines.
- Stable base plate for load-bearing constructions.
- Versatile usage possibilities for stepped lengths.
- Slots in the rail offer versatile installation possibilities.
- For fastening:
- Pipe tracks and pipe lines.
- Ventilation ducts.
- Cable trays.
- Fittings and equipment.
- Properties:
- Zinc plating: Electro zinc plated, min. 8  $\mu\text{m}$ .
- Material:
- Base plate: Steel DC01 (material no. 1.0330) acc. to DIN EN 10111.
- Channel: Steel S235JR (material no. 1.0037) acc. to DIN EN 1025.

- FHS Clix N – patented T-head bolt with grooved pin.
- Grooved pin can be shortened using bolt cutter.
- FHS Clix – for small rail profiles (27/18, 28/30, 30/15)
- Advantages / Benefits:
- Patented safety mechanism.
- Simple, fast and effective installation.
- Fewer individual parts than with previous fastening.
- Retrofitting in rails possible.
- Simple alignment in the rail.
- Fits in all the usual rail profiles with 15 mm slot width.
- As a connection element between:
- Rail load-bearing constructions and pipe clamps.
- Cantilever brackets and pipe clamps.
- Properties:
- Material: Steel DD11 (material no. 1.0332) acc. to DIN EN 10111.
- Zinc plating: Electro zinc plated, 8 µm.

- Installation angle brackets are support elements for use with load-bearing constructions that should not be welded.
- Installation angle brackets are used to reinforce load-bearing constructions.
- Advantages / Benefits:
- Installation advantages in producing load-bearing constructions in connection with fischer mounting rails.
- No welding necessary.
- System component can be used in many ways.
- Variable installation possibilities.
- For producing:
- Rail load-bearing structures.
- Traverses.
- Projections.
- Supports.
- Properties:
- Material: Steel S235 JR (material no. 1.0037) acc. to DIN EN 10025.
- Zinc plating: Electro zinc plated, 8 µm.

- Stable angle bracket for fixing pipe lines and components.
- The angle bracket acts as a reinforcement for load-bearing constructions.
- Advantages/Benefits:
- Versatile possibilities for wall, floor and ceiling installation, can be used in shafts and also free-standing.
- In combination with fischer mounting rails, the universal bracket produces a load-bearing construction with very high stability and safety.
- For producing:
- Rail load-bearing structures, traverses, projections
- For fastening:
- Pipe tracks and pipe lines, pipe line components such as fittings, water meters.
- Properties:
- Material: Steel DD11 (material no. 1.0332) acc. to DIN EN 10111.
- Zinc plating: Electro zinc plated, 8 µm.

- Connecting element for producing robust constructions in connection with the fischer mounting rails.
- Advantages / Benefits:
- Solid connecting element for load-bearing constructions.
- Simple installation by inserting the mounting rail in the saddle.
- For producing:
- Rail load-bearing structures.
- Traverses.
- Projections.
- Properties:
- Material:
- Base plate: Steel DD11 (material no. 1.0332) acc. to DIN EN 10111.
- U-Profil: S235JR acc. to DIN EN 10025.
- Zinc plating: Electro zinc plated, 8 µm.

## Beam clamp

### Technical data

| Type       | TKR27/18    | TKR38/40 |

- Stirrup for fastening profile rails to steel girders.
- Advantages / Benefits:
- No drilling or welding necessary.
- Adjustment is possible at any time.
- Due to the different lengths of the claw sides, the fischer clamp supporter can be fastened to all standard T-beams.
- For fastening:
- Rails to steel girders

## Channel connector

### Technical data

| Type | Profile     |
|------|-------------|
| SV27 | 27/18+28/30 |
| SV38 | 38/40       |

### Assembly sequence

- The channel connectors are inserted into the rail ends and then screwed tight.

- Mounting rails can be connected and aligned precisely with the fischer channel connector.
- Advantages / Benefits.
- Robust and fast connection of mounting rails.
- Simple installation by sliding into the mounting rail.
- Screws enable secure connection.
- For producing:
- Channel connections.
- Properties:
- Material SV 27 / SV 38: Steel DC01 (material no. 1.0330) acc. to DIN EN 10130.
- Zinc plating: Electro zinc plated, 8 µm

## Parallel connector

### Technical data

|      |       |
|------|-------|
| Type | PV M8 |
| N    | 2.00  |

- Simply and quickly installed connector for extending and/or connecting threaded rods.
- Advantages / Benefits:
- Fast installation.
- Simple level adjustment possible.
- High load possible.
- Level adjustment even in installed position.
- For fastening:
- Fast level adjustment of threaded rods or threaded pins.
- Properties:
- Material diecasting.

## Clamp hanger

### Technical data

| Type    | N    | K    | d   |
|---------|------|------|-----|
| TKL M8  | 2.50 | 0-23 | M8  |

- Clamp hanger makes simple fastening possible by clamping to steel girders.
- Advantages / Benefits:
  - High load-bearing capability.
  - Simple and fast level adjustment.
  - Level adjustment is also possible later with through-hole.
  - VdS approval.
  - Fastening on steel girder without welding and drilling.
  - No slipping of the clamp from the steel girder.
  - For fastening:
    - Pipe lines, ventilation lines and sprinkler lines on steel girders.
- Properties:
  - Material: Malleable cast iron EN-GJMB-350-10 acc. to DIN 1562.
  - Zinc plating: Electro zinc plated, 8 µm.
  - Bolt: Hexagonal bolt DIN 933.8.8, bolt end with cup point acc. to EN ISO 4753 and lock nut.

## Perforated steel banding

### Technical data

| Type | LBV 17 | LBV 26 |
|------|--------|--------|
| L    | 10     | 10     |
| B    | 17     | 25     |
| S    | 0.75   | 0.88   |
| d    | 6.5    | 8.5    |

- To be fastened with: ED 15; ED 18; ED 22.

### Assembly sequence

- Simple cutting to size possible with sheet metal shears.
- Floor fastening using the Fischer impact nail ED.
- For ceiling suspension in concrete, the Fischer nail anchor FNA II is recommended.

- Steel band with stamped holes for simple installation in zinc plated or plastic coated version.
- Advantages/Benefits
- Advantageous, simple installation possible.
- Universal fastening possible.
- Flexible length selection.
- For fastening:
- Pipe lines on the floor or suspended from ceiling.
- Properties:
- Material: Steel DX51 D+Z (material no. 1.0226) acc. to DIN EN 10327.
- Zinc plating: sendzimir zinc plated, 5 - 27 µm.

- Ideal connecting element for double connector plates and multi-connectors.
- Properties:
- Material: Steel S235 JR (material no. 1.0037) acc. to DIN EN 10025.
- Zinc plating: Electro zinc plated, 8 µm.

## FABORY FASTCLIP Fixing system

### General

The FABORY FASTCLIP fixing system consists of a basic clip, which can be installed trouble-free on steel structures either as a single hanger or in combination with accessories, simply by hand or using handtools like a hammer, combination pliers, screwdriver. Considerable savings of costs and time can be achieved.

### Application

FABORY FASTCLIP fixing clips with their various combination possibilities are widely used in the general building industry, e.g. in the electrotechnical installation technics, ceiling-, sanitary-, air conditioning- and heating industry.

### Standardisation

The FABORY FASTCLIP fixing system has been tested in accordance to DIN 18168.

### Loads

Load rating of these fasteners is expressed in Newton as static load limit. Values indicate maximum allowable installed loads for user applications. Static load limit is a rated stationary load limit for a fastener.

Ultimate static load limit is the rated stationary load limit which, if exceeded, may cause failure of fastener. These values are for loads applied vertically to the normal fastener installation. When load rating of the fasteners exceeds that of the structural member, the lowest rated item must set the load limit. FABORY FASTCLIP fixing clips are punched out of spring steel and hardened.

### Surface treatment

FABORY FASTCLIP fixing clips are treated with an anti-corrosion layer named DELTATONE, layer thickness 10-12 µm (corrosion resistance in saltspray test acc. to ASTM B117/DIN 50021 ca. 480 hours). DELTATONE eliminates the possibility of fracture due to hydrogen embrittlement!

# FABORY QUICK SYSTEM

## Toggle latches

### Application

FABORY toggle latches have a place of importance in the FABORY QUICK SYSTEM, their wide applicability varies from, for example the closing of the covers of simple wooden component cases to the efficient secural of the engine compartments of agricultural machinery.

### Assembly

The principle of operation of the FABORY QUICK SYSTEM toggle latches is identical, regardless of the size, the lockability and the adjustability. The toggle itself is fastened to one side of the component and the strike is fastened to the other part. For closing the construction, the toggle is pulled over the strike and is tensioned by lowering the latch. Off-centring of the pivot point and the gripping point of the toggle in the strike ensures that the latch cannot unclutch. The closure spring is generally slightly bent and absorbs a great deal of the closing force despite small tolerances in the mounting in or on the various parts.

### Presentation

Since experience has taught that the available mounting space generally determines the final choice of the FABORY QUICK SYSTEM toggle latch, the following presentation of the extensive toggle latch product range is given in order of physical size, therefore see details of the smallest models first and largest models are described last. A distinction is also made between the steel models and the stainlesssteel models. In each presentation is tried to give an overview of all the relevant information in such a way that it can be read at one glance.

### Special data

A number of specific data is given for each FABORY QUICK SYSTEM toggle latch such as the load data, the standard finish and, where relevant, the specific properties of the closure such as its adjustability and the possibility for locking if you require more protection against unwanted opening of the toggle latch.

### Strikes

The mounting preparation information assumes the use of the indicated toggle latch in combination with the recommended strike. The use of alternative strikes is of course possible, the right mounting preparation of the parts must then be determined by trial.

### Specials

Depending on the application, special toggle latches, other shapes of strikes, different finishes etc. are available on request.

### Example of application

For further technical data on sizes, loads, examples of application and assembly sequences, an extensive FABORY QUICK SYSTEM brochure is available on request.

## Toggle latch

- Technical brochure available on request.

## FABORY QUICK SYSTEM

### Pawl latches

#### Application

FABORY QUICK SYSTEM pawl latches are mainly used for locking installation boxes, cabinet doors, machinery cabinets etc.

#### Assembly

The FABORY QUICK SYSTEM pawl latch locking is mounted on the panel or door. On operation of the locking mechanism, the pawl mounted on the locking engages behind the frame part and thus makes a secure fastening.

#### Function

The pawl of the FABORY QUICK SYSTEM lockings are identical in function; for size, method of operation and manufacture, i.e. material (black polyamid with zinc inner parts, chrome plated zinc and stainless steel), there is a wide choice. With the standard models both an internal O-ring and a sealing ring for under the head are supplied with which the fastenings are splashproof in conformance with IP65.

#### Types

FABORY QUICK SYSTEM pawl latches are available in a large type and in a small type.

#### Technical and assembly data

Large type

Small type

Grip range KL

For further technical data on sizes, loads, examples of application and assembly sequences, an extensive FABORY QUICK SYSTEM brochure is available on request.

## Quarter turn fasteners

### General

A *FABORY QUICK SYSTEM* quarter turn fastener is a simple, fast and reliable fastener meant for connecting panels to a frame or components to one another.

### Application

*FABORY QUICK SYSTEM* quarter turn fasteners are used for mounting panels or components in a fast and servicefriendly manner that must be removed or replaced for maintenance. It does not matter whether this operation must be done once a month or many times per hour.

### Principle

In its simplest form a *FABORY QUICK SYSTEM* quarter turn fastener consists of a stud mounted on the panel by means of a retainer and a receptacle mounted on the frame.

### Assembly

A *FABORY QUICK SYSTEM* quarter turn fastener is fastened by pressing, while a quarter turn breaks the bond, see assembly data below.

### Assembly data

For further technical data on sizes, loads, examples of application and assembly sequences, an extensive *FABORY QUICK SYSTEM* brochure is available on request.

## Insert type C

### Technical data

| d  | P   | $m_1$ | Drill $\phi$ |
|----|-----|-------|--------------|
| M3 | 0,5 | 5     | 4,7          |
| M4 | 0,7 | 5     | 5,6          |
| M5 | 0,8 | 6     | 6,8          |
| M6 | 1   | 7     | 7,7          |

- Special features of inserts:
- Are highly suitable to provide soft materials like plastic, wood, chipboard and aluminium with strong ISO-metric thread in a fast and efficient way.
- During assembly the teeth are anchoring into the wall of the hole.
- The connection is selflocking against vibrations and shocks.
- Type C with one row of teeth is recommended for low forces and less frequent disassembly.

|----------------|-----|-----|
| d              | M3  | M4  |
| P              | 0,5 | 0,7 |
| m <sub>2</sub> | 8   | 8   |
| Drill ø        | 4,7 | 5,6 |

#### Special features of inserts:

- are highly suitable to provide soft materials like plastic, wood, chipboard and aluminium with strong ISO-metric thread in a fast and efficient way.
- during assembly the teeth are anchoring into the wall of the hole.
- the connection is self-locking against vibrations and shocks.
- Type E (shorter version of type D) with two rows of teeth may be used for wood, larger forces and frequent disassembly.

## ***FABORY SECURITY Fasteners***

*FABORY SECURITY* fasteners are suitable for fixing all products which you want to protect for hands of thieves. You can fasten everything what needs to be fixed. From outdoor lights up to advertising billboards. By using the *FABORY SECURITY* fasteners the so-called "opportunity theft" will be reduced to a minimum, as the potential thief will not have the appropriate tools to loosen the product to be taken. Only you as engineer will have the correct wrenches, so unfastening will be done only by you. As you see using the *FABORY SECURITY* fasteners will be a good fastening system together with an investment in safety. When you want to be on top of things use *FABORY SECURITY* fasteners. They only can be unfastened if you want them to!

## Security nut

### Technical data

| d      | P    | h ≈ |
|--------|------|-----|
| M6-4k  | 1    | 6,2 |
| M8-4k  | 1,25 | 7   |
| M10-4k | 1,5  | 6,8 |
| M12-6k | 1,75 | 7,3 |

- SECURITY nuts are up to and including M10 square formed, M12 is hexagonal formed with the size 31 mm.

### Assembly sequence

Special features FABORY SECURITY nuts:

- assembly has always to be done with two identical nuts
- screw the first nut onto the bolt by hand. Install the second nut upside down to a half-turn distance from the first nut resulting in a diabolicshaped unity. Both nuts can now be torqued simultaneously with an adjustable wrench. After this the upper nut can be removed by hand.
- disassembly: screw a second nut upside down onto the bolt by hand to a half-turn distance of the already assembled nut. Loosen both nuts simultaneously with an adjustable wrench.

| <b>43081</b>             | <b>ABA Hose clamp band width 9mm</b> | <b>Y01A</b>   |
| <b>Material</b>          | Steel                                |   |
| <b>Surface treatment</b> | Zinc plated                          |   |
| <b>Packaging</b>         | Standard                             |   |

Special features of ABA hose clamps:

- with the **BLUE** one piece pressed housing (ABA patent)
- rolled-up band edges, no damage of the hose
- smooth band underside that protects the hose
- easy to install and to loosen due to the hexagon slotted head
- re-usable many times

| <b>Packaging</b>                            | Standard           |   |

Special features of ABA hose clamps:

- with the one piece pressed stainless steel housing (ABA patent)
- rolled-up band edges, no damage of the hose
- smooth band underside that protects the hose
- easy to install and to loosen due to the hexagon slotted head
- re-usable many times

- Special features of ABA rubber lined clips:
- With rubber (EPDM) profile
- High resistance to water, wear, temperature fluctuations and ageing
- Especially for vibration-damping suspension of pipes, cables, cable circuits and hoses etc.

- Special features of fork joints:
- Are supplied complete with a spring pin type ES.
- Due to the spring catch the hinge joints can be used much faster and easier without a tool than with the traditional method by means of a clevis pin with small head acc. to DIN 1434, a split pin (cotter pin) acc. to DIN 94 and a plain washer for clevis pins acc. to DIN 1440.
- Typical applications of fork joints are windscreen wipers, brake-gas or couplingrods and transmission of linear movements.
- Tolerance d<sub>1</sub> = H9/h11.

- Domed cover zinc plated, blue passivated, vibration isolation material natural rubber (NR) 60° Shore (tol. ± 5°) and footplate zinc plated, yellow passivated.

Special features FABORY mountings type RA:

- suitable for the effective isolation of vibration and noise on different machines with rotating movements, like compressors, combusting engines, generators, converters, pumps, industrial and marin gen sets, fans, for use with presses, punches and other workshop machines.
- fitted as standard with an integral fail-safe design device with resilient stop.

- Domed cover zinc plated, blue passivated, vibration isolation material natural rubber (NR) 60° Shore (tol. ± 5°) and footplate zinc plated, yellow passivated.

Special features of FABORY mountings type RAEM:

- for applications demanding maximum isolation.
- suitable for the effective isolation of vibration and noise on different machines with rotating movements, like compressors, AC units, industrial fans, generators, combusting engines, emergency power sets, large milling machinery, industrial and marine gen sets, refiners and defibrators.
- fitted as standard with an integral fail-safe design device with resilient stop.

- Domed cover zinc plated, blue passivated, vibration isolation material butyl rubber (NR) 55° Shore (tol. ± 5°) and footplate zinc plated, yellow passivated.

Special features of FABORY mountings type RAB:

- optimum stiffness characteristics and horizontal stability
- especially effective on small 1, 2 and 3 cylinder diesel engines
- fitted as standard with an integral fail-safe design device with resilient stop

- Cover plate zinc plated, yellow passivated, vibration isolation material natural rubber (NR) 60° Shore (tol. ± 5°) and footplate zinc plated, yellow passivated.

Special features of FABORY mountings type M:

- high elastic, vertical as well as horizontal
- also suitable for shock attenuation
- the harmful effect of oil can often be avoided through the design of the mounting or by fitting a mechanical shield

| <b>Assembly data</b>     |       |        |
| Max. pull-out force in N | 1500  | 4000   |

- Special features of mountings type SE:
- A simple mounting, friction is normally sufficient to prevent the suspended equipment from "walking"
- Suitable for office equipment, textile machinery, domestic appliances, electric motors, weighing equipment
- Cover plate zinc plated, yellow passivated, and vibration isolation material natural rubber (NR) 50° Shore.

- Steel class 8.8 with rubber NBR profile.
- The adjustent bolt is up to and including type T20 with a square head bolt, above type T20 with a hexagon head bolt.
- Static load per flexible machine support in kN.
- Dynamic load per flexible machine support in kN for presses, max. number of strokes are stated per minute.
- Other sorts of rubber and/or hardness or longer adjustment bolts are available on request.

## Anti-vibration plate

- Special features of anti-vibration plates:
- Intended, primarily, for applications with low demands on vibration isolation.
- If insufficient deflection is achieved by a single layer, multiple layers can be used
- Oil and grease resistant rubber material.
- Max. allowable compr. load in  $N/cm^2 = 50$ .

| 57802 Anti-vibration plate |              | S12A      |                               |

- With a steel insert.

## FABORY Technical balls

### Standardisation

FABORY technical balls are acc. to DIN 5401-1 and 5401-2 equal to ISO 3290 standardized. Not standardized FABORY technical balls are acc. to the highest qualities.

### Stock

FABORY technical balls are available from stock in many diameters, tolerances and hardnesses in following materials: chrome steel, carbon steel, forged steel, stainless steel, plastic, glass etc.

### Specials

Special products are available on request.

### Applications

FABORY technical balls are e.g. applicable for cylindrical lockings, ballpoints, cigar lighters, drawer guidances, spray guns, forged railings and -fencings, video recorders and for grinding, bearings, sealings, deburring and polishing.

Technical brochure available on request.

- Specific features of grommets:
- Protect electric wire in sheet iron.
- Excellent insulation.
- Strong and safe.
- Reducing vibration.

| h2 | 4   | 5   | 6,5  | 7,5 |

- Specific features of protective buffers:
- Soft yet very strong flexible buffer.
- For mounting in iron work, sliding facades and such.
- Low buildingheight and tight neat finish
- Simple mounting with single screw connection or drive rivet

- Specific features of slide bearings:
- Manufactured out of self-lubricating nylon 6.6 and designed with buffercollar
- Insensitive to dirt, weatherinfluences and most chemicals
- Extremely fit for soundless hinges, low R.P.M. machines
- Also electric insulating between axle and bearinghouse
- Suitable for h6-H7 fitting
- After assembly bearing clearance approx 1% of the shaft diameter

- Accurate cylindrical plug with a good sealing.
- For sealing of temporary drill holes or screwthread holes but also for lengthly protection.
- Great clampability, therefore utmost reliable also in difficult situations.

- The tapered design of these products allows them to be used as either a cap or a plug, providing easy fitting and removal in most applications, they provides excellent protection against damage, dirt, moisture and corrosion, during storage and transportation.
- When used as a plug dimension b should be min. 5% larger than the opening, diameters over 30mm may require more interference.
- When used as a cap dimension c should be min. 5% less than the diameter to be capped, diameters over 30mm may require more interference.

- Short version.
- For push- and pull-clamping.
- Supplied complete with tempered, galvanized clamping screw.

**15930 Push-pull type toggle clamp 6842**
**F97A**

**Material** Steel  
**Surface treatment** Zinc plated  
**Packaging** Standard

## 1 Introduction

Designing and producing safe fastenings demands for professional knowledge, experience and information. Important aspects such as dimensional tolerances, mechanical and chemical properties must be considered. Also the directives for the calculation, assembly and securing of fastenings are of extreme importance. All this information is scattered over a wide range of standards, technical directives and publications in various languages.

Fabory has collected the most important technical information that is frequently consulted by product developers, designers, purchasers and contractors. A large part of this is based on international (ISO) and European (EN) standards. It is necessary to observe that although most national standards such as DIN have become obsolete and replaced by corresponding ISO or EN standards, the market situation often still requires fasteners to DIN. Where appropriate we have included information on those DIN standards as well.

Of course much more technical information is available at Fabory. Please contact our technical specialists if specific information is not found in this technical section, or if more detail is required.

Also keep in mind that Fabory has the technical competence to give professional advice and help on many fastening subjects and applications. At Fabory, a team of fastener experts is devoted to help customers with safe and innovative fastening solutions.

Although all technical specifications and data have been compiled with the greatest care, the companies belonging to or affiliated to the Fabory Group accept no liability whatsoever in connection with this information and the way it is used.

## 2 Mechanical properties of fasteners

### 2.1 Mechanical properties of carbon and alloy steel bolts, screws and studs

#### 2.1.1 Field of application

The property classes and their associated mechanical properties, as defined in ISO 898-1:2009 apply to bolts, screws and studs with metric (ISO) thread, with nominal diameters up to and including 39 mm, made of carbon steel or alloy steel and when tested at room temperature.

They do not apply to set screws and similar threaded fasteners not under tensile stresses (ref. ISO 898-5) or to specific requirements such as weldability, corrosion resistance (stainless steel ref. ISO 3506-1), ability to withstand temperatures above 150°C or below -50°C. (ref. DIN 267-13). The class designation system may be used for other sizes (e.g.  $d > 39$  mm), provided that all of the mechanical properties in the table are met.

Certain fasteners might not fulfil the tensile or torsional requirement of ISO 898-1 because of the geometry of their heads (e.g. low heads, countersunk heads) or because of a reduced shank.

#### 2.1.2 Designation system of property classes

The property class symbols, indicating the most important mechanical properties, consist of two numbers separated by a dot, for example 10.9.

The first number indicates 1/100 of the nominal tensile strength in  $\text{N/mm}^2$  (see  $R_m$  in the table). So property class 10.9 has a tensile strength of  $10 \times 100 = 1000 \text{ N/mm}^2$ .

The second number indicates 10 times the *ratio* between lower yield stress  $R_{el}$  (or proof stress  $R_{p0.2}$  or non-proportional elongation  $R_{pf}$ ) and the nominal tensile strength  $R_m$  (yield strength ratio).

So at property class 10.9 the second figure 9 is derived from the formula:  $10 \times \frac{900}{1000}$

The nominal yield stress of this example (10.9) can easily be calculated by multiplying 10 times the product of the two property class numbers:  $10 \times 10 \times 9 = 900 \text{ N/mm}^2$ .

Remark: a fastener with the same property class 10.9 but with reduced loadability is designated by 010.9!

### 2.1.3 Marking of bolts, socket head cap screws and studs

Fig. 1

Fig. 2

Fig. 3

- Marking is obligatory for hexagon and hexalobular bolts and screws with nominal diameter  $d \geq M5$ , of all property classes, preferably on top of the head (fig.1).
- Marking is obligatory for hexagon and hexalobular socket head cap screws with nominal diameter  $d \geq M5$ , of all property classes, preferably on top of the head (fig.2).
- When carbon steels with additives (e.g. B, Mn, Cr or Mo) are used for class 12.9, the symbol 12.9 shall be underlined: 12.9
- Studs with nominal diameter  $d \geq M5$  and property classes  $\geq 5.6$ , shall be marked on the shaft or on the nut end (required if thread with interference fit) (fig.3). Alternative identification with symbols (fig.4) is permissible.
- Left-hand thread shall be marked for nominal diameters  $d \geq M5$  with the symbol shown in figure 5, either on the top of the head or on the point. Alternative marking, as shown in figure 6, may be used for hexagon bolts and screws. (fig.6)
- The manufacturer's designation is mandatory on all products that are marked with property classes.
- If marking is required for other types of bolts and screws, the same marking system shall be used.
- Marking is not usual for screws with flat countersunk head, oval countersunk head, cheese head, pan head or similar that have internal driving features.

|                            |     |     |     |      |      |
|----------------------------|-----|-----|-----|------|------|
| Property class             | 5.6 | 8.8 | 9.8 | 10.9 | 12.9 |
| Alternative Marking symbol | —   | ○   | +   | □    | △    |

### Remarks:

- a Values do not apply for structural bolting
- b For structural bolting d ≥ M12
- c Nominal values are specified only for the purpose of the designations system for property classes
- d If the lower yield strength cannot be determined, a measurement of the stress at 0,2% non-proportional elongation is permissible
- e Values under investigation
- g Max hardness at the end of a fastener shall be max. 250 HV
- h Surface hardness shall not be more than 30HV<sub>0.3</sub> above the measured core HV<sub>0.3</sub> hardness
- i Max. 390 HV
- j Max. 435 HV
- k Test temperature -20°C
- l Applies to d ≥ 16mm
- m Value under investigation

## 2.1.5 Decarburization

The mechanical properties of heat treated steel are determined to a high degree by its carbon content. No air must be allowed to enter the furnaces during the hardening process of steel bolts in property classes 8.8, 10.9 and 12.9, otherwise the carbon that is present in on the surface of the steel would be oxidized by hot air.

This is the reason that the continuous furnaces for the hardening process are equipped with fire curtains, and protective gas is supplied to the furnaces to keep the oxygen level in control.

A loss of carbon content (decarburization), caused by heat treatment processes, beyond the limits specified in the table of par. 1.1.4, can reduce the strength of the thread and could cause failure.

Zones of decarburization in the thread:

1. Completely decarburized
2. Partially decarburized
3. Pitch line
4. Base metal
- E. Height of the non-decarburized thread zone
- G. Depth of complete decarburization in the thread
- H<sub>1</sub> Height of external thread in maximum material condition

### 2.1.6 Minimum breaking torques

Often smaller screw diameters cannot be tensile tested. ISO 898-7:1995 defines the minimum breaking torques below which a bolt or screw may not rupture if clamped according to the test procedure. These values are not applicable for hexagon socket set screws.

| Basic diameter | Pitch P | Property class              |       |       |       |       |       |       |
|----------------|---------|-----------------------------|-------|-------|-------|-------|-------|-------|
|                |         | 4.6                         | 4.8   | 5.6   | 5.8   | 8.8   | 10.9  | 12.9  |
|                |         | Minimum breaking torque, Nm |       |       |       |       |       |       |
| M1             | 0,25    | 0,020                       | 0,020 | 0,024 | 0,024 | 0,033 | 0,040 | 0,045 |
| M1.2           | 0,25    | 0,045                       | 0,046 | 0,054 | 0,055 | 0,075 | 0,092 | 0,10  |
| M1.4           | 0,3     | 0,070                       | 0,073 | 0,084 | 0,087 | 0,12  | 0,14  | 0,16  |

| M8             | 1,25    | 19                          | 20    | 23    | 24    | 33    | 40    | 44    |
| M8 x 1         | 1       | 23                          | 23    | 27    | 28    | 38    | 46    | 52    |
| M10            | 1,5     | 39                          | 41    | 47    | 49    | 66    | 81    | 90    |
| M10 x 1        | 1       | 50                          | 52    | 60    | 62    | 84    | 103   | 114   |
| M10 x 1,25     | 1,25    | 44                          | 46    | 53    | 54    | 74    | 90    | 100   |

The minimum breaking torque values given in the table shall apply to bolts and screws assigned to thread tolerance classes 6g, 6f or 6e.

### 2.1.7 Influence of elevated temperatures on mechanical properties

Up to a service temperature of 150°C, no detrimental effects due to a change of mechanical properties of fasteners with property classes to ISO 898-1 are known. However at temperatures over 150°C and up to a maximum temperature of 300°C, the functional performance should be ensured carefully.

With increasing temperature, a progressive reduction of lower yield strength or stress at non-proportional elongation and a reduction of tensile strength can be experienced.

The continuous operating of fasteners at elevated temperatures can result in stress relaxation, which accompanies a loss of clamp force.

DIN 267-13 defines fastener materials with specific mechanical properties for use at temperatures ranging from -200°C to +700°C.

## 2.2 Mechanical properties of carbon and low alloy steel nuts

### 2.2.1 Field of application

The property classes and their associated mechanical properties, are defined in ISO 898-2:1992 and apply to nuts with metric (ISO) thread, with nominal diameters up to and including 39 mm, made of carbon steel or low alloy steel and when tested at room temperature.

ISO 898-2 does not apply to nuts with specific requirements such as weldability, corrosion resistance (stainless steel ref. ISO 3506-2), ability to withstand temperatures above 300°C or below -50°C. (ref. DIN 267-13). The class designation system may be used for other sizes (e.g.  $d > 39$  mm), provided that all of the mechanical properties in the table are met.

ISO 898-2 is applicable to nuts with nominal height  $\geq 0,8d$  and low nuts with nominal height  $\geq 0,5d$  but  $< 0,8d$ .

#### Important remark on nuts with property classes to DIN:

Nuts according to obsolete DIN standards, such as DIN 934 (with nominal heights of approximately 0,8d), cannot be loaded reliably up to the yield point of the corresponding bolt. The mechanical properties of these nuts are described in the withdrawn standard DIN 267-4.

**For new designs it is highly recommended to apply nuts with property classes according to ISO standards instead of the obsolete DIN standards!**

### 2.2.2 Designation system of property classes

Nuts with nominal heights  $\geq 0,8d$  ( $d$ =nominal thread size), are designated by a number to indicate the maximum appropriate property class of bolts with which they can be mated. This number is approximately 1/100 of the proof stress of the nut in  $N/mm^2$  and corresponds to the maximum nominal tensile strength of the mating bolt.

A bolt of property class 10.9 must be paired with a nut of property class 10 (or higher). Using this combination, the bolt can be loaded up to the yield point.

Failure of threaded fasteners due to over-tightening can occur by bolt shank fracture or by stripping of the threads of the nut and/or bolt.

| Property class of nut | Mating bolts    |              | Nuts Style 1 | Nuts Style 2     |
|-----------------------|-----------------|--------------|--------------|------------------|
|                       | Property class  | Thread range | Thread range |                  |
| 4                     | 3.6 / 4.6 / 4.8 | $> M16$      | $> M16$      | --               |
| 5                     | 3.6 / 4.6 / 4.8 | $\leq M16$   | $\leq M39$   |                  |
|                       | 5.6 / 5.8       | $\leq M39$   |              |                  |
| 6                     | 6.8             | $\leq M39$   | $\leq M39$   |                  |
| 8                     | 8.8             | $\leq M39$   | $\leq M39$   | $> M16 \leq M39$ |
| 9                     | 9.8             | $\leq M16$   | --           | $\leq M16$       |
| 10                    | 10.9            | $\leq M39$   | $\leq M39$   | -                |
| 12                    | 12.9            | $\leq M39$   | $\leq M16$   | $\leq M39$       |

In general, nuts of a higher property class can be used instead of nuts of a lower class. This is recommended for an assembly that is torqued to a higher stress than the yield stress or the proof load stress.

Example of Nut style 1: ISO 4032

Example of Nut style 2: ISO 4033

Nuts with nominal heights  $\geq 0,5d$  but  $< 0,8d$  are designated by a combination of two numbers:

The first number is "0" and indicates the loadability is reduced.

The second number indicates the nominal stress under proof load on a hardened test mandrel.

Property classes of nuts with reduced loadability acc. to ISO 898-2: "04" and "05".

### 2.2.3 Marking of steel nuts

Hexagon nuts  $\geq$  M 5 of all property classes shall be marked on the side or on a bearing surface with the property class designation and where technically possible the manufacturer's mark (see figure 1). Left-hand threads for nuts  $\geq$  M 5 must be marked on the bearing surface with a counter-clockwise arrow or with a groove halfway up the nut (see figure 2).

Fig.1

Fig.2

#### Important remark on nuts with property classes to DIN:

Hexagon nuts  $\geq$  M5, with mechanical properties according to the obsolete DIN 267-4, shall be marked with the symbol of the property class, a vertical bar on either side of the symbol and the manufacturer's designation on the bearing surface or flat (see figure 3).

Fig. 3

## 2.2.4 Mechanical properties of steel nuts

The details below are based on ISO 898-2:1992

| Property class acc. ISO 898-2 |                     |                   | Thread size (coarse metric thread, tolerance class 6H) |             |              |               |               |                |
|-------------------------------|---------------------|-------------------|--|-------------|--------------|---------------|---------------|----------------|
|                               |                     |                   | d ≤ M4   | M4 < d ≤ M7 | M7 < d ≤ M10 | M10 < d ≤ M16 | M16 < d ≤ M39 | M39 < d ≤ M100 |

|                               | Vickers hardness HV | min.              | 295 <sup>1)</sup>                                      |             |              | –             | –             |                |
|                               |                     |                   | 272 <sup>2)</sup>                                      |             |              |               | –             |                |
|                               |                     | max.              | 353  |             |              |               |               | –              |

<sup>1)</sup> For nuts as per ISO 4032 (type 1).

<sup>2)</sup> For nuts as per ISO 4033 (type 2).

### Remarks:

- The minimum hardness values only apply for nuts where loading tests at the proof load value can **not** be carried out and for quenched and tempered nuts. For all other nuts the minimum hardness values are for guidance only. The minimum hardness values for nominal diameters in the range 39 to 100 mm are for guidance only.
- Mechanical properties of nuts with fine metric thread are significantly different. Ref. ISO 898-6.
- Nuts with thread tolerance other than 6H have reduced thread strength (e.g. 7H or 6G).

### Important remark on nuts with property classes according to DIN:

The proof load stress of hexagon nuts, with mechanical properties according to the obsolete DIN 267-4, can be significantly lower:

| Thread size  |       | Property classes                       |           |           |           |           |           |           |           |

**For new designs it is highly recommended to apply nuts with property classes according to ISO standards instead of the obsolete DIN standards!**

## 2.3 Corrosion-resistant stainless steel fasteners

### 2.3.1 Field of application

Mechanical properties of stainless steel fasteners are defined in ISO 3506:2009 parts 1 to 4:

Part 1: Bolts, screws and studs

Part 2: Nuts

Part 3: Set screws and similar fasteners not under tensile stress

Part 4: Tapping screws

The term “STAINLESS” steel is used to refer to a wide range of materials, all of which have at least 12% chromium (Cr) and normally also other alloying elements, with nickel (Ni) and molybdenum (Mo) being the most important. In these steels chromic oxide will be formed at the surface, which protects it from corrosion. At elevated temperatures chrome will tend to form carbides instead of oxide.

For fasteners, the extensive range of stainless steels has been subdivided according to ISO 3506 into 3 material groups based on their metallurgical structure:

Austenitic (A)

Martensitic (C)

Ferritic (F)

The martensitic and ferritic groups are of hardly any importance for commercial fasteners. The austenitic material group - also referred to as chromium-nickel steel - is the most used for fasteners and is further subdivided into 5 steel grades, each with a different resistance to corrosion and a specific field of application.

A1:

A free-cutting steel grade, having superior machinability due to a higher percentage of phosphorus and sulphur. As a consequence however, general corrosion resistance is reduced. This “free cutting” stainless steel is seldom used for mass produced fasteners.

A2:

The most frequently used stainless steel grade (for mass production of fasteners) - also called 18/8 (18% Cr, 8% Ni) - with outstanding corrosion resistance under normal atmospheric conditions, in wet environments and when exposed to oxidizing and organic acids, and many alkaline solutions. However A2 is not suitable for use in non-oxidizing acids and agents with chloride content, i.e. in swimming pools and sea water.

A3:

This is a stabilized stainless steel with A2 properties. Due to elements Ti, Nb or Ta which reduce the binding of carbon to chromium, this steel grade is particularly suitable for use at elevated temperatures. It is relatively rarely used for mass produced fasteners.

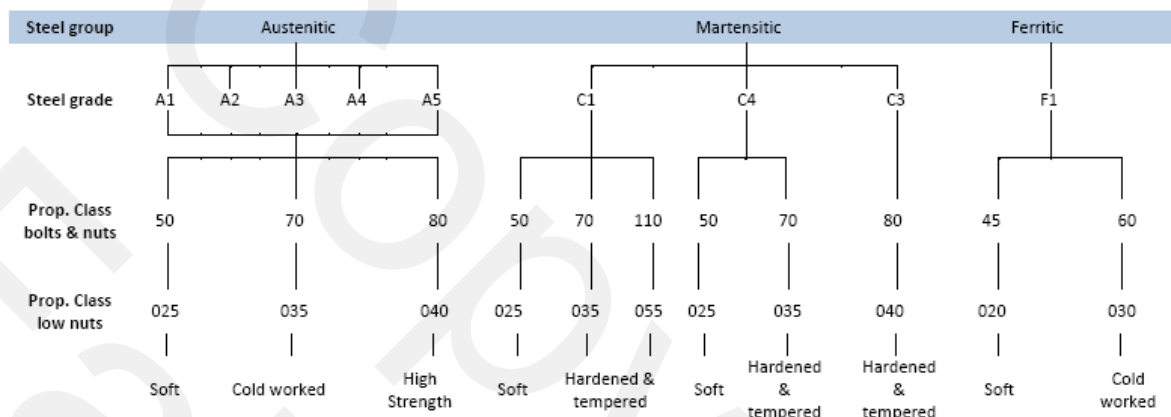

A4:

Steels of grade A4 are “acid proof steels”, which are Mo alloyed and give a considerably better corrosion resistance in aggressive conditions such as those found in sea climates (chlorides), industrial atmospheres (sulphur dioxide), where oxidizing acids are present and if pitting may occur. However in aggressive conditions such as offshore, high chloride environment or similar applications, steels with a higher content of Cr, Ni and in particular Mo are required.

A5:

This is a stabilized stainless steel with A4 properties. Due to elements Ti, Nb or Ta which reduce the binding of carbon to chromium, this steel grade is particularly suitable for use at elevated temperatures. It is relatively rarely used for mass produced fasteners.

### 2.3.2 Designation system of property classes

The designation of the property class represents 1/10 of the tensile strength (bolt or screw) or 1/10 of the stress under proof load for nuts. If the first digit is “0”, this indicates the nut has a reduced loadability compared to a normal nut.

### 2.3.3 Marking of austenitic stainless steel fasteners

Stainless steel hexagon bolts and nuts and socket cap screws of size M5 and above and all packaging shall be marked with the manufacturer's identification mark and the steel grade, followed by the two (or three) digits of the property class or as an alternative for turned nuts by grooving, see examples below. If the property class is not indicated, property class 50 or 025 applies. Low carbon austenitic stainless steel with carbon content not exceeding 0,03% may additionally be marked with an “L”.

Marking of studs and other fasteners shall be agreed on by user and manufacturer.

### 2.3.4 Mechanical and other physical properties of austenitic stainless steel fasteners

Mechanical properties of austenitic stainless steel bolts, screws, studs and nuts:

| Stainless steel   |             | Property class | Bolts and screws   |  |   | Nuts type 1                                     |
|---|-------------|----------------|--|--|---|---|
| Steel group   | Steel grade |                | Tensile strength $R_m$ <sup>1)</sup><br>min. N/mm <sup>2</sup> | 0.2% yield strength $R_{p0.2}$ <sup>1)</sup><br>min. N/mm <sup>2</sup> | Elongation at fracture $A$ <sup>2)</sup><br>min. mm | Proof load value $Sp$ min.<br>N/mm <sup>2</sup> |
| Austenitic  | A1, A2,     | 50             | 500  | 210  | 0,6d  | 500   |
|   | A3, A4,     | 70             | 700  | 450  | 0,4d  | 700   |
|   | A5          | 80             | 800  | 600  | 0,3d  | 800   |
| <sup>1)</sup> Values are calculated on the nominal stress area (ref. Thread sizes tables)                     |             |                |  |  |   |   |
| <sup>2)</sup> Determined according to ISO 3506-1 on the actual screw length and not on a prepared test piece. |             |                |  |  |   |   |

Minimum breaking torque in Nm for austenitic stainless steel grade bolts and screws M1,6 to M16 (coarse thread):

| Nominal thread size | Property class 50 | Property class 70 | Property class 80 |
|---------------------|-------------------|-------------------|-------------------|
| M1.6                | 0.15              | 0.2               | 0.24              |
| M2                  | 0.3               | 0.4               | 0.48              |
| M2.5                | 0.6               | 0.9               | 0.96              |
| M3                  | 1.1               | 1.6               | 1.76              |
| M4                  | 2.7               | 3.8               | 4.32              |
| M5                  | 5.5               | 7.8               | 8.8               |
| M6                  | 9.3               | 13                | 15                |
| M8                  | 23                | 32                | 37                |
| M10                 | 46                | 65                | 74                |
| M12                 | 80                | 110               | 130               |
| M16                 | 210               | 290               | 330               |

0.2% yield strength ( $R_{p0.2}$ ) of austenitic stainless steel at elevated temperatures:

| Steel grade   | +100°C           | +200°C           | +300°C           | +400°C           |
|---|------------------|------------------|------------------|------------------|
| A2, A3, A4, A5  | 85 <sup>1)</sup> | 80 <sup>1)</sup> | 75 <sup>1)</sup> | 70 <sup>1)</sup> |
| <sup>1)</sup> These values are given as a % of the values at room temperature. The values only apply to fasteners assigned to property classes 70 and 80. |                  |                  |                  |                  |

Application at low temperatures:

| Steel grade   | Lower limits of operational temperature at continuous operation |        |
|---|---|--------|
| A2, A3  | -200°C  |        |
| A4, A5  | bolts and screws <sup>1)</sup>                                  | -60°C  |
|   | studs   | -200°C |
| <sup>1)</sup> In connection with the alloying element Mo, the stability of the austenite is reduced and the transition temperature is shifted to higher values, if a high degree of deformation during the production of the fastener is applied. |   |        |

Magnetic properties:

Austenitic stainless steel fasteners generally are non-magnetic. However after cold working, some magnetic properties may be evident. In this respect A4 is better than A2 with A1 being the most unfavourable. Some applications like those for electrotechnical equipment, and in marine and nuclear industry, require a magnetic permeability as close as possible to 1.0. Ex stock fasteners are not suitable for these purposes and special non-magnetisable steel types must be mutually agreed on.

### 3 Thread

#### 3.1 Metric (ISO) screw thread, coarse series – M

Basic profile and limiting profiles

The bold lines indicate the maximum material profiles. The maximum material profile of the internal thread is the basic profile.

|                                 |                                       |                                       |
|---------------------------------|---------------------------------------|---------------------------------------|
| <b>B</b> = basic major diameter | <b>d</b> = major diameter             | <b>D</b> = major diameter             |
| <b>P</b> = pitch                | <b>d<sub>3</sub></b> = minor diameter | <b>D<sub>1</sub></b> = minor diameter |
|                                 | <b>d<sub>2</sub></b> = pitch diameter | <b>D<sub>2</sub></b> = pitch diameter |

##### 3.1.1 Limit dimensions for metric screw thread, coarse series, fit 6H/6g

The table below is based on ISO 965-1 (1998). Dimensions in mm.

| Basic <sup>2)</sup> diameter | Pitch    | External thread tolerance 6g <sup>1)</sup><br>(bolts and screws) |                         |                          |                          |                          |                          | Internal thread tolerance 6H <sup>1)</sup><br>(nuts) |                          |                          |                          | Section at minor diameter           | Stress area                         |
|------------------------------|----------|--|-------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--|--------------------------|--------------------------|--------------------------|-------------------------------------|-------------------------------------|
|                              |          | Major diameter   |                         | Pitch diameter           |                          | Minor diameter           |                          | Pitch diameter                                       |                          | Minor diameter           |                          | $\frac{\pi}{4}d_3^2$                | $\frac{\pi}{4}(d_2+d_3)^2$          |

1. The values for basic diameters 1 to 1.4 mm correspond to the fit 5H/6h.  
 2. Metric screw thread is designated by the basic diameter, preceded by the profile letter M and followed by the tolerance grade, e.g. 6, and the tolerance position, e.g. g. Example: M10-6g. If no tolerance class is indicated, the above mentioned fits are valid.  
 For basic diameters above 68mm. See metric screw thread, fine series.

### 3.2 Metric (ISO) screw thread, fine series – MF

#### Basic profile and limiting profiles

The bold lines indicate the maximum material profiles. The maximum material profile of the internal thread is the basic profile.

**External thread**  
 d = major diameter  
 d<sub>3</sub> = minor diameter  
 d<sub>2</sub> = pitch diameter  
**Internal thread**  
 D = major diameter  
 D<sub>1</sub> = minor diameter  
 D<sub>2</sub> = pitch diameter  
 B = basic major diameter  
 P = pitch

#### 3.2.1 Limit dimensions for metric screw thread, fine series, fit 6H/6g

The table below is based on ISO 965-1 (1998). Dimensions in mm.

| Basic <sup>2)</sup><br>Dia. | Pitch<br>P | External thread tolerance 6g <sup>1)</sup><br>(bolts and screws) |                   |                    |                    |                    |                    | Internal thread tolerance 6H <sup>1)</sup><br>(nuts) |                    |                    |                    | Section<br>at minor<br>Dia.<br>$\frac{\pi}{4} d_3^2$ | Stress<br>area<br>$\frac{\pi}{4} \left( \frac{d_2 + d_3}{2} \right)^2$ |

1 For coated threads the maximum values of d, d<sub>2</sub> and d<sub>3</sub> are equal to the values of the basic profile. (d<sub>2max.</sub> = D<sub>2min.</sub> and d<sub>3max.</sub> = D<sub>3min.</sub>)  
 2 Metric screw thread, fine series, are designated by the basic diameter, preceded by the profile letter M and followed by the pitch separated by an x and then by the tolerance grade, e.g. 6, and the tolerance position, e.g. H. Example: M10x1,25-6H. If no tolerance class is mentioned, the fit 6H/6g applies.

### 3.3 Screw threads, fine versus coarse thread

#### 3.3.1 Explanation

The general trend for commercial fasteners has shown a gradual and noticeable shift in popularity towards coarse threads. And rightly so, as there are increasingly less reasons to justify the use of fine threads. Although fine threads are used in special cases (such as for adjusters, or for certain engine screws), these cases occur so infrequently that fasteners with fine thread are becoming more and more a special product with all the attendant economic disadvantages (higher price, poor availability, double stocking)  
The fine screw thread was mainly created for, and is still popular in, the automotive industry - and other related industries.

The most important arguments of the proponents of fine thread are:

- higher static tensile strength because of the thread's larger stress area
- because of the smaller helix angle, it offers more resistance to loosening when subjected to vibration
- improved adjustment accuracy

In practice however, most constructions are not loaded statically but dynamically, so fatigue strength is the criterion. Coarse thread exhibits better fatigue resistance because stress concentration at the root decreases as thread pitch increases. The argument of better resistance to loosening has been outdated by the development of mechanical and chemical locking systems, which offer a more effective solution for loss of preload especially when the fastener is exposed to dynamic transverse forces.

Further advantages of coarse thread are:

- less sensitive to damage, and generally easier and quicker assembly
- thicker coatings possible as a consequence of the larger thread allowances
- less danger of thread being stripped

The most important pros and cons are summarised in the following evaluation table:

| functional properties         | screw thread coarse <sup>1)</sup> | screw thread fine |
|-------------------------------|-----------------------------------|-------------------|
| static strength               | +                                 | ++                |
| dynamic strength              | +                                 | -                 |
| Resistance to loosening       | -                                 | +                 |
| Insensitive to damage         | +                                 | -                 |
| Coating thickness             | +                                 | -                 |
| Insensitive to being stripped | +                                 | -                 |
| Ease of assembly              | +                                 | -                 |
| Low cost/availability         | +                                 | -                 |

1) Coarse thread is recommended for standardized fasteners in general constructions.

### 3.4 Metric screw threads with tolerance class Sk6 for DIN 939 studs

#### Basic profile and limiting profiles

The bold line indicates the minimum material profile.

- P = Pitch
- d = major diameter = basic size
- $d_2$  = pitch diameter
- $d_3$  = minor diameter

The tolerance class Sk6 is used for general applications e.g. the inserted end of studs as per DIN 939 (joints without a seal function) and in combination with internal thread, with the tolerance class fine (4H respectively. 4H5H) as per DIN 13 Part 14. In fact, these tolerance classes for the pitch diameter have to do with a transition fit, because in many cases no actual interference fit will be achieved.

Note:

A true interference fit for metric threads has been developed (MFS), which is achieved by including the oversize in the major diameter. Refer to DIN 8141 Part 1 for the tolerances and to DIN 8141 Part 2 for the associated sizes of the threads. However, these norms only apply to applications in aluminium cast alloys for the sizes M5 through M16. Further developments are dependent on the experience gained.

#### 3.4.1 Limit dimensions for metric screw thread with tolerance class Sk6

The table below is based on DIN 13-51 (2005). Dimensions in mm.

| Basic diameter     | Pitch | external thread (studs) |            |                |             |                |             |
|--------------------|-------|-------------------------|------------|----------------|-------------|----------------|-------------|
|                    |       | major diameter          |            | pitch diameter |             | minor diameter |             |
| d                  | P     | $d_{max.}$              | $d_{min.}$ | $d_{2max.}$    | $d_{2min.}$ | $d_{3max.}$    | $d_{3min.}$ |
| 6                  | 1     | 6                       | 5,776      | 5,406          | 5,335       | 4,773          | 4,663       |

#### 3.5.2 Thread ends for tapping screw thread

Type C (Cone)

Type F (Flat)

Type R (Rounded)

### 3.6 Metric-fine tapered external screw thread – DIN 158-1

Metric-fine tapered external screw thread is intended to be used for liquid-/gas- tight joints such as pipe plugs as per DIN 906, lubricating nipples, etc. Up to and including M26 no sealing medium is required for oils, other liquids and gases; for sizes above M26 a sealing medium is recommended on the thread. The tapered external thread is normally combined with parallel internal thread as per DIN 158. The metric-fine tapered external thread is designated by the basic diameter, preceded by the profile letter M and followed by the pitch, separated by an "x". E.g.: M 20x1.5.

#### 3.6.1 Limit dimensions for tapered external screw thread, short type

The table below is based on DIN 158-1 (1997). Dimensions in mm.

| Basic diameter x P | major diameter    |                   | pitch diameter     |                    | minor diameter     |                    | Gauge length<br>b | Useful Thread length<br>l <sub>1</sub> |
|--------------------|-------------------|-------------------|--------------------|--------------------|--------------------|--------------------|-------------------|--|

### 3.7 Whitworth tapered external pipe thread R – DIN 3858

#### 3.7.1 Nominal sizes for tapered external thread with tolerance 2, short type a

The table below is based on DIN 3858 (2005). Dimensions in mm.

| Designation                    | Number of threads N | Pitch P | external thread  |                      |                      |                |                            |
|--------------------------------|---------------------|---------|------------------|----------------------|----------------------|----------------|----------------------------|
|                                |                     |         | major diameter d | pitch diameter $d_2$ | minor diameter $d_1$ | Gauge length a | Useful thread length $l_1$ |
| R <sup>1</sup> / <sub>8</sub>  | 28                  | 0,907   | 9,728            | 9,147                | 8,566                | 3              | 5,5                        |
| R <sup>1</sup> / <sub>4</sub>  | 19                  | 1,337   | 13,157           | 12,301               | 11,445               | 4,5            | 8,2                        |
| R <sup>3</sup> / <sub>8</sub>  | 19                  | 1,337   | 16,662           | 15,806               | 14,950               | 4,5            | 8,2                        |
| R <sup>1</sup> / <sub>2</sub>  | 14                  | 1,814   | 20,955           | 19,793               | 18,631               | 5              | 10,0                       |
| R <sup>3</sup> / <sub>4</sub>  | 14                  | 1,814   | 26,441           | 25,279               | 24,117               | 6              | 11,0                       |
| R1                             | 11                  | 2,309   | 33,249           | 31,770               | 30,291               | 7              | 13,4                       |
| R1 <sup>1</sup> / <sub>4</sub> | 11                  | 2,309   | 41,910           | 40,431               | 38,952               | 7,5            | 13,9                       |
| R1 <sup>1</sup> / <sub>2</sub> | 11                  | 2,309   | 47,803           | 46,324               | 44,845               | 7,5            | 13,9                       |

The Whitworth tapered external pipe thread is designated by the profile letter R, followed by the basic diameter in inches, e.g.: R1/8.

### 3.8 Parallel pipe thread G – ISO 228-1

The bold line is the basic profile.

pitch  
number of threads per inch

**External thread**  
d = major diameter  
d<sub>1</sub> = minor diameter  
d<sub>2</sub> = pitch diameter

**Internal thread**  
D = major diameter  
D<sub>1</sub> = minor diameter  
D<sub>2</sub> = pitch diameter

Whitworth parallel pipe thread - G is intended to be used for mechanical pressure-tight joints for fittings, valves, cocks, etc. where the seal is not made on the thread. This screw thread is designated by the profile letter G, followed by the basic diameter in inches and, for external thread, followed by the capital A or B of the tolerance class. E.g.: for external thread G <sup>1</sup>/<sub>2</sub> A and for internal thread G <sup>1</sup>/<sub>2</sub>.

#### 3.8.1 Limit dimensions for parallel pipe thread - G

The table below is based on ISO 228-1 (2000). Dimensions in mm.

| external thread, tolerance class A |                   |                   |                   |                    |                    |                    | internal thread                |                   |                |                |                    |                    |                    |
|------------------------------------|-------------------|-------------------|-------------------|--------------------|--------------------|--------------------|--------------------------------|-------------------|----------------|----------------|--------------------|--------------------|--------------------|
| Designation                        | number of threads | major diameter    |                   | pitch diameter     |                    | minor diameter     | Designation                    | number of threads | major diameter | pitch diameter |                    | minor diameter     |                    |

## 4 Basic standards

### 4.1 Drilling sizes for tapping screws and bolts

#### 4.1.1 Application guidelines

The essential characteristic of tapping screw thread is its ability to form a chipless internal thread in a core hole made in the materials to be joined. These core hole data, which are theoretically calculated and based on actual tests, apply to fasteners with tapping screw thread as per ISO 1478 and only for application in metals with the tensile strengths indicated in the tables. They do not apply for use in plastics for which several modified tapping screw threads have been developed. They also do not apply for use in stainless steel. It is not possible to provide general recommendations and a determination must be made on a case by case basis of the conditions under which such joints are possible. This also applies to stainless steel tapping screws.

Surface coatings can have such an influence on coefficients of friction when driving in screws that the core hole size must be amended.

In sheet thickness up to 2 mm, the holes are usually punched, not drilled. Due to the cold work hardening of the hole wall, the holes must be made 0.1 to 0.3 mm larger, depending on material and sheet thickness. Ensure that the screw is inserted in the punch direction and not from the other side.

- Tapping screws with point type C and type R (see previous chapter) are most commonly used, especially through multiple sheets where the pilot point enables the holes to be aligned.
- Tapping screws with tap type F (see previous chapter) are preferred for use where protruding sharp points may cause problems e.g. injuries.

#### 4.1.2 Application possibilities

Sheet thicknesses not thinner than the pitch of the screw thread.

Thinner sheet thicknesses

### 4.1.3 Guidelines for core hole diameters db

The tables below are based on DIN 7975 (1989). Dimensions in mm.

| Core hole diameters for tapping screw thread ST2,2 |   |     |     |     |     |     |     |     |     | Core hole diameters for tapping screw thread ST2,9 |   |     |     |     |     |     |     |     |     |

<sup>1</sup> These core hole diameter values apply for a simple tapping screw joint with a clearance hole in the upper sheet and a drilled hole in the lower sheet and for uncoated tapping screws.

<sup>2</sup> The minimum sheet thickness has been chosen in such a way that the drive-in torque will not exceed 50 % of the minimum breaking torque according to ISO 2702. This upper limit is about 0.8 of the nominal diameter of the screw e.g. ST4,2 can be used in sheet that is no more than 0.8 x 4.2 = 3.5 mm thick.

Guidelines for the diameter of clearance holes:

The minimum diameter of clearance holes can be calculated using the formula:

$$d_D = d_1 + 1/3(d_1 - d_b) \text{ mm}$$

where:  $d_D$  = diameter clearance hole  
 $d_1$  = nominal diameter of tapping screw thread  
 $d_b$  = core hole diameter

*Example:*

The minimum diameter of the clearance hole for a tapping screw with an ST6,3 screw thread in material that is 4 mm thick and that has a tensile strength of 350 N/mm<sup>2</sup> will be  $d_D = 6,3 + 1/3(6,3 - 5,7) = 6,5$  mm.

## 4.2 Core holes for thread forming screws in metals (Taptite 2000)

### 4.2.1 Recommendations for drilled and punched holes in materials in the hardness range up to 150 HB, 500 N/mm<sup>2</sup>

The core hole diameters (between bolt marked horizontal blue lines) in below table are determined experimentally by manufacturers and users, dependent on the various types of material, material thicknesses or drive-in depths. These values are **for guidance only**.

Manufacturing processes (e.g. punching) that cause cold work hardening of the hole wall, require a somewhat larger diameter. This may also apply to cast holes (harder casting scale).

Recommended tolerance class for the core holes: H11.

Especially for mass production purposes, it is recommended to perform tests in order to achieve an optimum result with respect to the combination of mechanical properties of the screw, the drive-in depth and the mechanical properties of the material in which the screws are to be mounted. It is recommended to start testing with the smallest advised diameter.

### 4.3 Core holes for thread forming screws in plastics (Remform)

#### 4.3.1 Recommendations for the geometry of holes and bosses for Remform screws

In principle, the geometry of the boss must conform to below picture.

These core hole diameters are determined experimentally using various types of plastics. These values are for guidance only and, especially in mass production, it is recommended that one's own tests be carried out in order to achieve an optimum result with respect to the different mechanical properties (e.g. temperature, load, time, speed).

Dimensions in mm. tolerance acc. DIN 16901

\*Plastics sensitive for stress cracking

## 4.4 Length of protrusion of bolt ends (v)

Hexagon nut

Prev. torque nut

Length of protrusion of the bolt end (v) is based on DIN 78 (2001)

For hexagon nuts:  $v = \text{nut height} + 2P$

For prevailing torque nuts:  $v = \text{nut height} + 3P$

Nominal length (l) = clamping length ( $l_k$ ) + protrusion length (v). The calculated values must be rounded off to the next (longer) standardized length.

Length of protrusion for hexagon slotted nuts, see DIN 34803

## 4.5 Drill sizes before tapping screw threads

### 4.5.1 General notes

These drill sizes are guide values for core hole diameters for tapping screw thread.

The tolerance limits of the screw thread must not be exceeded. Depending on material, tools and manufacturing method it may be necessary to deviate from these guide values and to determine the actual drill size experimentally.

For metric and unified screw threads (ISO-profile), in principle the following formula applies:  
drill size = nominal screw thread size - pitch, if necessary rounded off.

### 4.5.2 Drill sizes Metric (ISO) screw thread - coarse - M

Based on ISO 2306 (1972). Dimensions in mm.

| screw thread size | drill size |
|-------------------|------------|
| M1                | 0,75       |

### 4.5.3 Drill sizes Metric (ISO) screw thread - fine - MF

Based on ISO 2306 (1972). Dimensions in mm.

| thread size x pitch | drill size | thread size x pitch | drill size | thread size x pitch | drill size |
|---------------------|------------|---------------------|------------|---------------------|------------|
| M3 x 0,35           | 2,65       | M5 x 0,5            | 4,5        | M10 x 1,25          | 8,8        |
| M3,5 x 0,35         | 3,15       | M6 x 0,75           | 5,2        | M12 x 1             | 11         |
| M4 x 0,5            | 3,5        | M8 x 1              | 7          | M12 x 1,25          | 10,8       |
| M4,5 x 0,5          | 4          | M10 x 1             | 9          | M12 x 1,5           | 10,5       |

| thread size x pitch | drill size | thread size x pitch | drill size | thread size x pitch | drill size |
|---------------------|------------|---------------------|------------|---------------------|------------|
| M14 x 1,5           | 12,5       | M20 x 1,5           | 18,5       | M24 x 1,5           | 22,5       |
| M16 x 1,5           | 14,5       | M20 x 2             | 18         | M24 x 2             | 22         |
| M18 x 1,5           | 16,5       | M22 x 1,5           | 20,5       | M27 x 1,5           | 25,5       |
| M18 x 2             | 16         | M22 x 2             | 20         | M27 x 2             | 25         |

### 4.5.4 Drill sizes Whitworth parallel pipe thread – G

Based on ISO 2306 (1972). Dimensions in mm.

| screw thread size x threads/inch | drill size | screw thread size x threads/inch | drill size | screw thread size x threads/inch | drill size |
|----------------------------------|------------|----------------------------------|------------|----------------------------------|------------|
| G $1/8$ x 28                     | 8,8        | G $5/8$ x 14                     | 21         | G $1 1/8$ x 11                   | 35,3       |
| G $1/4$ x 19                     | 11,8       | G $3/4$ x 14                     | 24,5       | G $1 1/4$ x 11                   | 39,5       |
| G $3/8$ x 19                     | 15,25      | G $7/8$ x 14                     | 28,25      | G $1 1/2$ x 11                   | 45         |
| G $1/2$ x 14                     | 19         | G 1 x 11                         | 30,75      | G $1 3/4$ x 11                   | 51         |

### 4.6 Width across flats according to ISO

The width across flats of some ISO-standardized hexagon nuts and bolts have changed compared to the obsolete DIN-standards. This only concerns fasteners with thread diameter M10, M12, M14 and M22.

Comparison of DIN and ISO widths across flats in the table below is based on ISO 272 (1982).

Dimensions in mm.

| Basic diameter                          | M10 | M12 | M14 | M22 |
|---|-----|-----|-----|-----|
| Width across flats according to DIN     | 17  | 19  | 22  | 32  |
| Width across flats according to ISO 272 | 16  | 18  | 21  | 34  |

## 5 Surface coatings for fasteners

### 5.1 Introduction

According to DIN 50900-1, corrosion of a metal is a reaction of this material with its environment that results in a measurable change of the metal and which can lead to a lower performance of the metal part or a complete system.

Several types of corrosion exist.

Some types of corrosion appear without the effect of a mechanical load on the product: surface corrosion, pitting, crevice corrosion, galvanic corrosion, chemical corrosion.

Others are initiated due to a combination with mechanical load: stress corrosion cracking, erosion.

The corrosion resistance of a coating is often expressed in a number of hours until white (zinc corrosion) or red (base metal corrosion) corrosion in a salt spray test acc. ISO 9227. Salt spray testing is a method to check whether the comparative quality of a corrosion protection is maintained. There is however seldom a direct relation between resistance to the action of salt spray and resistance to corrosion in other media, because several factors influencing the progress of corrosion vary greatly with the conditions encountered. Therefore the performance of different coating types during such corrosion test should not be taken as a direct guide to the corrosion resistance in service.

Several measures can be taken to prevent or delay corrosion of fasteners, such as proper design of the fastening, proper choice of materials, application of a suitable coating system.

In the table section of this manual, one can find a Contact corrosion table and a Chemical corrosion table which can be a first help to determine an acceptable material type in a corrosive environment.

This chapter only handles surface coatings which are suitable for fasteners.

#### 5.1.1 Overview of coating systems

Coatings can be divided into metallic and non-metallic systems.

Metallic (inorganic) coatings:

- Electrolytical applied coatings (acc. ISO 4042) such as zinc, zinc-iron, nickel, ...
- Chemical (electroless) plating: chemical nickel plating
- Hot dip galvanized (ISO 10684): thick coating of zinc, applied by dipping in melted zinc
- Diffusion coatings: metal powder applied at elevated temperature (sherardizing, chromating)
- Mechanical plating (ISO 12683): zinc powder mechanically applied
- Dispersion coatings(ISO 10683): zincflakes applied in a dispersive solution

Non-metallic coatings:

- Oil: generally applied on plain fasteners to reduce risk of corrosion during storage
- Black oxidized: not a real coating, conversion of the steel surface to iron oxide by immersion in a hot alkaline liquid
- Phosphating (ISO 3892): chemically applied zinc- of manganesephosphate coating, normally combined with oil to give some corrosion protection
- Chromate passivation (EN12329): supplementary coating on e.g. zinc to further improve its corrosion resistance
- Thin lacquer coatings: several coatings such as PTFE, Teflon, KTL

Most often applied on fasteners are "active" coatings. Such coatings (e.g. zinc) provide "cathodical" protection, which means that the coating will sacrifice in favour of the metal to be protected. The advantage of active coatings is that even with small damages they will delay severe base metal corrosion.

"Passive" coatings are those that seal the material from the environment, e.g. Teflon. Such coatings have the disadvantage that corrosion will proceed rapidly once the coating is damaged.

Sometimes a combination of coatings is applied, often called "duplex coating".

### 5.1.2 Coating thickness limits

The degree of protection against corrosion is generally proportional to the thickness of the applied coating. For threaded fasteners the maximum layer thickness that can be applied depends on the allowance between the maximum size of the external thread and the minimum size of the internal thread. To prevent the nut/bolt thread seizing during assembly, the maximum nominal layer thickness should not exceed ¼ of this allowance.

The table below (acc ISO 4042) provides the allowance and maximum layer thickness for each pitch. Most coatings have a thickness that may vary depending on the location on the fastener. For electroplated coatings, ISO 4042 has defined the relationship between length/diameter ratio and the maximum coating thickness.

| External thread |  |                       |                                 |                  |              |               |
|-----------------|--|-----------------------|---------------------------------|------------------|--------------|---------------|
| Pitch P         | Nominal thread diameter d <sup>1</sup> | Fundamental allowance | Tolerance position g            |                  |              |               |
|                 |  |                       | Nominal maximum layer thickness |                  |              |               |
|                 |  |                       | All nominal lengths             | Nominal length L |              |               |
|                 |  |                       |                                 | L ≤ 5d           | 5d < L ≤ 10d | 10d < L ≤ 15d |
| mm              | µm                                     | µm                    | µm                              | µm               | µm           |               |
| 0,2             |  | -17                   | 3                               | 3                | 3            | 3             |
| 0,25            | 1; 1,2                                 | -18                   | 3                               | 3                | 3            | 3             |
| 0,3             | 1,4                                    | -18                   | 3                               | 3                | 3            | 3             |
| 0,35            | 1,6 (1,8)                              | -19                   | 3                               | 3                | 3            | 3             |

| 5               | 48 (52)                                | -71                   | 15                              | 15               | 12           | 10            |
| 5,5             | 56 (60)                                | -75                   | 15                              | 15               | 15           | 12            |
| 6               | 64                                     | -80                   | 20                              | 20               | 15           | 12            |

<sup>1</sup> This information concerning coarse screw threads is only provided for reasons of convenience. The pitch is normative.  
<sup>2</sup> Maximum nominal layer thicknesses for local measurement.  
<sup>3</sup> Maximum nominal layer thicknesses if a measurement based on the average layer thickness of a batch is agreed in accordance with the method shown in ISO 4042, annex B.

### 5.1.3 Hydrogen embrittlement

When atomic hydrogen enters steel, it can cause catastrophic brittle cracking at applied stresses well below the yield strength. This phenomenon is often referred to as hydrogen induced delayed brittle failure or hydrogen embrittlement. Typical is that failure due to hydrogen embrittlement occurs a few hours or days after assembly.

Hydrogen can be introduced during several treatments such as cleaning, pickling, electroplating...but also in the service environment as a result of cathodic protection reactions or corrosion reactions.

Hydrogen embrittlement is most likely to occur in products:

- With tensile strength  $\geq 1000 \text{ N/mm}^2$
- With a hardness  $\geq 320 \text{ HV}$
- That are case hardened.

In order to reduce the risk of failure by hydrogen embrittlement, susceptible parts shall be baked within 4 hours after electroplating and before passivation to a part temperature of 200°C to 230°C. Nevertheless a guarantee cannot be given that parts are free of brittleness after such baking treatment.

Especially for very high tensile screws, such as class 12.9, it is strongly desencouraged to apply coatings that carry a risk for H-embrittlement (e.g. electroplating).

Standard coatings that are generally with low risk for H-embrittlement: zinc flake coatings, hot dip galvanized.

### 5.1.4 European directives RoHS and ELV

RoHS: Restriction on Hazardous Substances (European Directive 2002/95/EC).

ELV: End of Live Vehicles (European Directive 2000/53/EC).

Both directives restrict the use of lead (Pb), mercury (Hg), cadmium (Cd) and hexavalent chromium (Cr<sup>6+</sup>).

RoHS is applicable to electric and electronic equipment, while ELV affects passenger cars.

Particularly the restriction on Cr<sup>6+</sup> is of importance for fastener coatings, as popular passivation layers such as yellow and black passivation, but also zincflake coatings such as Dacromet, contain an unacceptable high level of this substance.

As for standard stock parts, Fabory has a broad assortment of Cr<sup>6+</sup>-free fasteners mainly

- Electrozinc plated, white passivated (Cr<sup>3+</sup>)
- Zinc flake coating flZnnc-600-L

On demand also many other Cr<sup>6+</sup>-free coatings are available.

### 5.2 Electroplating

An electroplated coating is a metallic layer that is deposited onto the surface of metal parts by immersing them in a solution containing an electrolyte and through which an electric current is passed.

The requirements for electroplated coatings on fasteners are defined in ISO 4042:1999.

A coding system can be used to define the coating metal, its thickness and the passivation layer.

The code consists of two capitals and a number in between.

- Code letter for the coating metal
- Code number for the minimum layer thickness
- Code letter for the type of passivation on top of the coating metal.

Code letter for the coating metal:

| code letter | coating metal                       | chemical symbol |
|-------------|-------------------------------------|-----------------|
| A           | Zinc                                | Zn              |
| B           | Cadmium                             | Cd              |
| C           | Copper                              | Cu              |
| D           | Brass                               | CuZn            |
| E           | Nickel                              | Ni              |
| F           | Nickel-Chromium <sup>1</sup>        | NiCr            |
| G           | Copper-Nickel                       | CuNi            |
| H           | Copper-Nickel-Chromium <sup>1</sup> | CuNiCr          |
| J           | Tin                                 | Sn              |
| K           | Copper-Tin                          | CuSn            |
| L           | Silver                              | Ag              |
| N           | Copper-Silver                       | CuAg            |
| P           | Zinc-nicle                          | ZnNi            |
| Q           | Zinc-cobalt                         | ZnCo            |
| R           | Zinc-iron                           | ZnFe            |

<sup>1</sup>Thickness of chrome layer ≈ 0.3µm.

Code number for the coating thickness:

| code number    | minimum layer thickness (coating structure) in $\mu\text{m}$ |                  |
|----------------|--|------------------|
|                | 1 coating metal  | 2 coating metals |
| 0 <sup>2</sup> | -  | -                |
| 1              | 3  | -                |
| 2              | 5  | 2+3              |
| 3              | 8  | 3+5              |
| 4              | 12   | 4+8              |
| 5              | 15   | 5+10             |
| 6              | 20   | 8+12             |
| 7 <sup>3</sup> | 25   | 10+15            |
| 8 <sup>3</sup> | 30   | 12+18            |

<sup>2</sup> Code number 0 applies to screw threads below M1.6 where no specific layer thickness can be specified.  
<sup>3</sup> Does not apply to threaded components.

Code letter for the chromate passivation layer:

| code letter | finish      | colour of the chromate passivation       |
|-------------|-------------|--|
| A           | dull        | no colour                                |
| B           |             | bluish to bluish iridescent <sup>1</sup> |
| C           |             | yellowish to yellowish-brown, iridescent |
| D           |             | olive green to olive brown               |
| E           | semi-bright | no colour                                |
| F           |             | bluish to bluish iridescent <sup>1</sup> |
| G           |             | yellowish to yellowish-brown, iridescent |
| H           |             | olive green to olive brown               |
| J           | bright      | no colour                                |
| K           |             | bluish to bluish iridescent <sup>1</sup> |
| L           |             | yellowish to yellowish-brown, iridescent |
| M           |             | olive green to olive brown               |
| N           | high bright | no colour                                |
| P           | optional    | like method B, C or D                    |
| R           | dull        | brownish black to black                  |
| S           | semi-bright |  |
| T           | bright      |  |

<sup>1</sup> Applies to Zn coating only

Example of coding: A3L

“A” means zinc-plated

“3” indicates the layer thickness of at least 8  $\mu\text{m}$

“L” refers to yellow chromating with a degree of gloss equal to “bright”

Example of designation: hexagon bolt ISO 4014 – M16 x 60 – 8.8 – A3L.

As a result of RoHS/ELV legislation and the high requirements of automotive industry for the corrosion resistance of Cr<sup>6+</sup>-free coatings, other passivation coatings and seals have been developed that are not yet standardized. More information can be requested at Fabory.

### 5.3 Hot dip galvanizing

Hot dip galvanized is defined as a protective zinc layer deposited onto the surface of steel parts, by immersing them in liquid zinc. Threaded parts generally need a spinning process immediately after the dip process. ISO 10684 (formerly DIN 267-10) specifies the material, process, dimensional and performance requirements for hot dip galvanized coatings applied to coarse thread steel fasteners from M8 up to M64.

Due to its high corrosion resistance in outdoor environment, hot dip galvanizing is the most applied coating system for fasteners in steel construction and building industry.

Internal thread is normally cut after the hot dip galvanizing process and is thus normally not coated. After assembly the internal thread is protected against corrosion by the hot dip galvanized external thread of the mating bolt.

The hot dip galvanizing of fasteners property class 10.9 involves specific procedures in order to prevent hydrogen embrittlement and microcracks in bolts  $\geq$  M27.

Coating thickness: minimum 40  $\mu\text{m}$ .

Due to the thickness of the coating, being more than the normal allowance between 6g and 6H thread tolerance class, special measures must be taken:

1. "Oversize thread" system:  
 Standard bolts with thread tolerance class 6g are hot dip galvanized and become "oversize" thread. These bolts have to be combined with nuts that have been tapped "oversize" (about 0.3 mm larger) after galvanizing. Therefore, they are not the usual thread fit. These bolts and nuts must be used as a set. This combination is usually employed and is recommended.
2. ISO-thread system:  
 For the second method, in accordance with ISO 10684, the thread size after hot dip galvanizing complies with ISO 965-1 class 6h/6H. Before hot dip galvanizing the external thread must therefore be thinner than the normal tolerance class 6g (undersized thread). This means that the bolts after hot dip galvanizing have to meet the tolerance position 6h. These "ISO metric" hot dip galvanized bolts must be mated with nuts that have been normally tapped after galvanizing and so must meet the go-gauge with tolerance position 6H. This method creates the usual thread fit and can therefore be used with nuts or in tapped holes that have the standard ISO metric thread.

**Important remarks:**

- **Care must be taken not to mix bolts and nuts of the "oversize thread" system with "ISO-thread" system, as failure of the fastening is inevitable !**
- **Attention is drawn to the fact that the proof loads of oversize tapped nuts and the proof loads of undersized threaded bolts and screws can be reduced as compared to the values specified in ISO 898-2 and ISO 898-1 respectively.**

## 5.4 Zinc flake coatings

A zinc flake coating (acc. ISO 10683) is a non-electrolytically applied coating which is produced by applying to the surface of a fastener a zinc flake dispersion, possibly with the addition of aluminum flakes. A suitable medium generates a bonding amongst the flakes and also between flakes and steel through heat curing. The thus formed inorganic surface coating is electrically conducting and ensures cathodic protection.

Compared to most electro zinc coatings, these zinc flake treatments offer a much higher corrosion resistance, without risk for hydrogen embrittlement.

ISO 10683 defines zinc flake coatings both with or without  $\text{Cr}^{6+}$ . The standard assortment of Fabory is the chromium-free type of zinc flake coating. This is indicated in the ISO-standard as flZnnc (fl = flake, Zn = Zinc, nc = no chrome).

The corrosion resistance of zinc flake coatings overperform conventional electro zinc plating by a multiple, with a comparable coating thickness. For its standard assortment, Fabory has chosen for a corrosion resistance of 480 hours for smaller thread diameters and 600 hours for the bigger sizes ( $>$ M8). This is specified in the ISO-standard as flZnnc-600.

Often neglected when specifying a coating, is the coefficient of friction. In most applications threaded fasteners must be tightened until a minimum clamping force is reached, without overloading nor the clamped parts, nor the fasteners themselves. Often this tightening process is controlled by a specified torque. Fabory has decided to choose for a lubricated zinc flake coating, with a coefficient of friction that is close to that of plain and normal zinc plated fasteners:  $\mu_{\text{tot}} = 0,12 - 0,18$ . The application of a lubricant is indicated with "L".

The zinc flake coatings selected for the standard Fabory assortment are specified compliant to ISO 10683 as "flZnnc-480-L" for fasteners up to M8 and as "flZnnc-600-L" for bigger sizes.

## 6 Inspection documents for fasteners

### 6.1 Test reports and certificates EN 10204

Originally inspection documents (certificate types) were specified in standard DIN 50049. The definitions of material testing and certificate types in DIN 50049 were the basis for European standard EN 10204, which was first published in 1991.

Both DIN 50049 and EN 10204 defined the certificate types 2.1, 2.2, 2.3, 3.1A, 3.1B, 3.1C and 3.2.

EN 10204 was last revised in 2004 with a simplified range of inspection documents (certificate types). These now only include types 2.1, 2.2, 3.1 and 3.2.

Type 2.3 has been deleted.

Type 3.1 replaces 3.1B

Type 3.2 replaces 3.1A, 3.1C and 3.2 of the previous edition.

The table below shows the full range of current (C= edition 2004) and withdrawn (W=edition 1995) EN 10204 certificate types, with some interpretation of what they cover.

| Certificate type | Title                                    | Status | Summary of EN10204 requirements   | Notes   |
|------------------|--|--------|---|---|
| 2.1              | Declaration of compliance with the order | C      | Statement of compliance with the order by the manufacturer.   | No test results shown.  |
| 2.2              | Test report                              | C      | Statement of compliance with the order by the manufacturer based on non-specific inspections (tests) by the manufacturer. | Sample test results from another lot number, manufactured by the same process route, can be used.   |
| 2.3              | Specific test report                     | W      | With mention of test results from specific inspection and testing   | Test results of the supplied lot number are needed on the certificate. Certificate issued and signed by manufacturer's representative, who does not need to be independent of the manufacturing department.   |
| 3.1              | Inspection certificate                   | C      | Statement of compliance with the order by the manufacturer with results of specific inspection                            | Replaces 3.1B. Common certificate type issued for the supplied lot number. Cert. issued and signed by manufacturer's representative, who must be independent of the manufacturing department. E.g. Inspection department manager/supervisor.  |
| 3.1A             | Inspection certificate 3.1A              | W      | With mention of test results from specific inspection and testing   | Test results for supplied lot number. Cert. issued by independent inspector required by releasing authority (eg TUV for German pressure vessels). Replaced by 3.2 in 2004   |
| 3.1B             | Inspection certificate 3.1B              | W      | With mention of test results from specific inspection and testing   | Test results for supplied lot number. Cert. issued and signed by manufacturer's representative. Replaced by 3.1 in 2004   |
| 3.1C             | Inspection certificate 3.1C              | W      | With mention of test results from specific inspection and testing   | Test results for supplied lot number. Cert. issued by independent inspector appointed by customer (eg Lloyds, accredited laboratory). Replaced by 3.2 in 2004   |
| 3.2              | Inspection certificate                   | C      | Statement of compliance with order with indication of results of specific inspection                                      | Test results for supplied lot number. Cert. issued by both manufacturer's representative and an independent inspector appointed either by the customer (cf withdrawn 3.1C) or an inspector designated by official regulations (cf withdrawn 3.1A). ie 3.2 now covers scope of both 3.1A and 3.1C of previous edition. |

The laboratory of Fabory is accredited according ISO/IEC 17025 as an independent testing laboratory for mechanical testing of fasteners, including chemical analyses. Inspection certificates issued by the laboratory are according EN 10204 type 3.1.C (1995 edition).

Testing Certificate No.: 931.01

## 6.2 PPAP documents

PPAP is an acronym for “Production Part Approval Process” and is usually pronounced “pee-pap”. The primary purpose of PPAP quality related documentation is to verify a manufacturer’s ability to produce and to consistently provide an automotive part that fully complies with purchase order requirements.

The PPAP system is unique to the automotive industry, however some other industries also are making use of it. The large amount of documentation is necessary to reduce the likelihood of an automotive part failure, which can reduce vehicle safety, vehicle reliability and customer satisfaction as well as interrupt new vehicle production.

Several PPAP Submission Levels are defined in the PPAP manual, published by the Automotive Industry Action Group (AIAG).

Five PPAP Submission Levels exist:

Level 1: Part Submission Warrant (PSW) only.

Level 2: PSW with product samples and limited supporting data.

Level 3: PSW with product samples and complete supporting data.

Level 4: PSW and other requirements as defined by the customer.

Level 5: PSW with product samples and complete supporting data available for review at the manufacturing location.

Generally a “Level 3” is required, for which the manufacturer must address an extensive list of topics:

- Design records
- Engineering changes
- Engineering approvals
- Design Failure Mode and Effects Analyses (DFMEA)
- Process flow diagrams
- Process failure mode and effects analysis (PFMEA)
- Control plan
- Measurement system analysis studies
- Dimensional results
- Material performance test results
- Initial process studies
- Qualified laboratory documentation
- Appearance Approval Report (if applicable)
- Sample product
- Records of compliance with customer-specific requirements
- Part Submission Warrant (PSW)

For (ISO, DIN, ...) standardized parts and in agreement with the customer, often the number of topics can be reduced significantly. Although generally PPAP documents must be set up by the manufacturer – by specific order - a customer can agree with Fabory to create a reduced PPAP by its accredited laboratory.

PPAP submissions generally are valid until a design or process change is made to a part by the manufacturer.

## 6.3 CE-certification

A large number of industrial products must be produced by a CE-certified manufacturer or given a CE mark. In the course of time, the number of products that require CE marking will be extended further.

The CE mark indicates that the product satisfies the European fundamental health and safety requirements required to bring the product to the market. These minimum requirements are listed in the European Guidelines.

The Guidelines do not contain the detailed technical specifications of the products. These technical specifications have been included in – mostly European - standards for many products.

Fasteners for which CE-marking is required:

**Due to Machinery directive (2006/42/EC):**

DIN 580 resp. DIN 582: Lifting eye bolts and -nuts if used as lifting equipment.

**Due to Construction Products Directive (89/106/EEC):**

EN 14399: High-strength structural bolting assemblies for preloading.

EN 15048: Non-preloaded structural bolting assemblies.

## 7 Directions for the design and assembly of fastenings

In order to ensure that threaded fastenings fulfil their function and do not work loose or fail, careful selection of the fasteners and the assembly method must be made for each individual application. Below information is based on the guideline VDI 2230:2003 "Systematic calculation of high duty bolted joints". Depending on the real assembly situation, it may be necessary to further investigate on the design and assembly directions.

### 7.1 Tightening torque tables for steel bolted joints

#### 7.1.1 Assembly preload / tightening torques - coarse pitch

The table below applies to shank bolts with metric thread according to ISO 262, head dimensions of hexagon bolts as per ISO 4014 – 4018 respectively hexagon (hexalobular) socket screws as per ISO 4762, and in clearance holes "medium" according to EN 20273.

Recommendations for tightening torques for other products different from the above mentioned standards and conditions can not be taken from this table and are available on request.

### 7.1.2 Assembly preload / tightening torques - fine pitch

The table below applies to shank bolts with fine metric thread according to ISO 262, head dimensions of hexagon bolts as per ISO 4014 – 4018 respectively hexagon (hexalobular) socket screws as per ISO 4762, and in clearance holes “medium” according to EN 20273.

Recommendations for tightening torques for other products different from the above mentioned standards and conditions can not be taken from this table and are available on request.

| Nom. diameter | Property class | Assembly preload $F_M$ in N<br>for $\mu_G =$ |          |         |         |         |         | Tightening torques $M_A$ in Nm<br>for $\mu_K = \mu_G =$ |      |      |      |      |      |      |       |

## 7.2 Tightening torque tables for stainless steel bolted joints

### 7.2.1 Assembly preload / tightening torques

The values below apply to austenitic stainless steel hexagon bolts ISO 4014 – 4018 respectively hexagon (hexalobular) socket screws as per ISO 4762. The torques are theoretically calculated values depending on the chosen friction coefficient and based on a preload, utilizing 90% of the minimum yield strength during assembly.

Recommendations for tightening torques for other products different from the above mentioned standards and conditions can not be taken from this table and are available on request.

| Friction coefficient |       | Assembly preload $F_M$ in kN<br>for $\mu_G=$ |       |       |       |       |       |       |      | Tightening torque $M_A$ in Nm<br>for $\mu_K= \mu_G=$ |       |       |       |       |       |       |       |

### 7.3 Coefficients of friction $\mu_G$ and $\mu_K$

Table below gives guidance for the choice of friction coefficients  $\mu_G$  and  $\mu_K$  ( $\mu_G$  = coefficient of friction of screw thread /  $\mu_K$  = coefficient of friction of bolt head or nut bearing surface). Depending on the detailed specification of the applied materials and lubricants, the friction coefficient can vary significantly.

| Typical examples   |   | Friction coefficient<br>$\mu_G$ and $\mu_K$ |
|--|---|---|
| Material / surface   | Lubricant   |   |
| Metallically bright<br>Black oxide<br>Phosphated<br>Galvanic coatings such as:<br>Zn, Zn/Fe, Zn/Ni<br>Zincflake coatings                     | Solid lubricants, such as:<br>MoS <sub>2</sub> , graphite, PTFE, PA, PE, PI in<br>lubricating varnishes as top coating or<br>in pastes;<br>Liquefied wax<br>Wax dispersions                                   | 0,04 to 0,10                                |
| Metallically bright<br>Black oxide<br>Phosphated<br>Galvanic coatings such as:<br>Zn, Zn/Fe, Zn/Ni<br>Zincflake coatings<br>Al and Mg alloys | Solid lubricants, such as:<br>MoS <sub>2</sub> , graphite, PTFE, PA, PE, PI in<br>lubricating varnishes as top coating or<br>in pastes;<br>Liquefied wax<br>Wax dispersions, greases;<br>Oils; delivery state | 0,08 to 0,16                                |
| Hot- galvanized  | MoS <sub>2</sub> , graphite;<br>Wax dispersions   |   |
| Organic coatings   | With integrated solid lubricant or wax<br>dispersion  |   |
| Austenitic steel   | Solid lubricants or waxes;<br>pastes  |   |
| Austenitic steel   | Wax dispersion, pastes  | 0,14 to 0,24                                |
| Metallically bright<br>Phosphated<br>Galvanic coatings such as:<br>Zn, Zn/Fe, Zn/Ni<br>Zincflake coatings<br>adhesive                        | Delivery state (light oiled)  |   |
| Austenitic steel   | none  |   |
| Galvanic coatings such as:<br>Zn, Zn/Fe;<br>Hot- galvanized  | oil   | 0,20 to 0,35                                |
| Galvanic coatings such as:<br>Zn/Fe, Zn/Ni;<br>Austenitic steel<br>Al and Mg alloys  | none  |   |

Note: If the coefficients of frictions are not experimentally determined, application of the smallest friction values from this table will reduce the risk of overtightening. (Fabory Technology dept. is able to do frictional test on special request and for critical applications.)

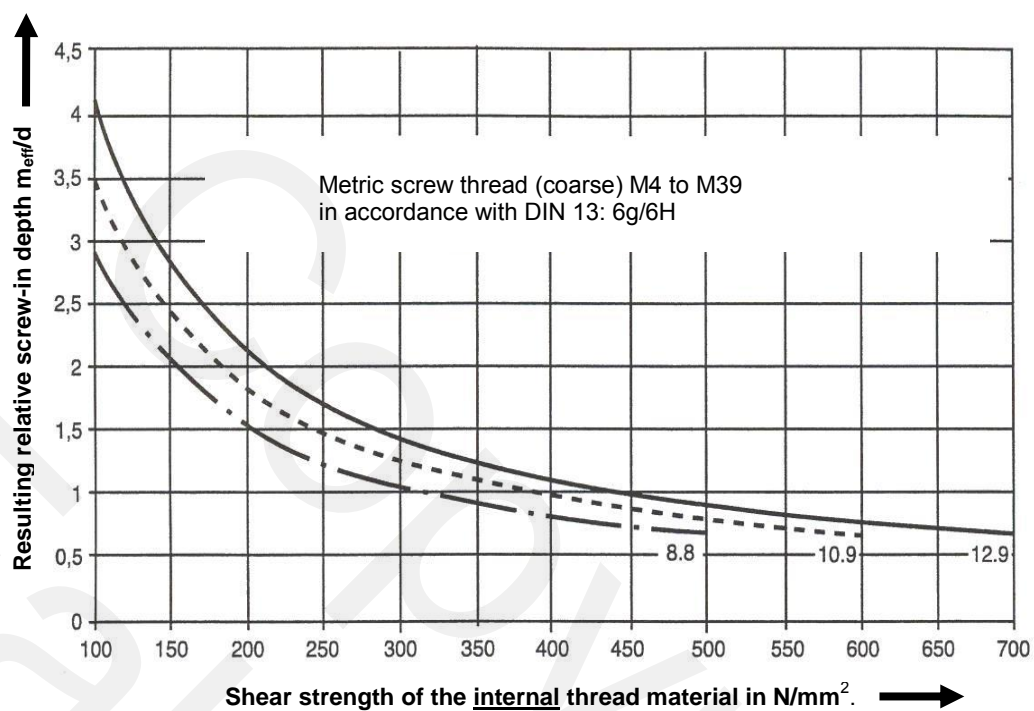

### 7.4 Galling (seizing) of stainless steel

The high ductility of austenitic stainless steel means that it is in general more susceptible to galling than normal steels. To avoid galling, the product must be clean, free of burs, foreign matter, chips, sand, etc. and one-sided clamping due to damage to the screw thread or crooked assembly must be avoided. Rigid joints perform better than elastic ones.

It is advisable to torque as uniformly as possible at low speed and not to use impact wrenches. It is noted that to induce a certain preload, it is not only the coefficients of friction that are important, but also the accuracy of the method used to tighten the bolts. The combination of two different grades of stainless steel (e.g. A2 and A4) is not advantageous as far as galling is concerned. In special circumstances and for special requirements a suitable (anti galling) lubricant / paste or pre-applied dry coating should be used. e.g.: lubricant/paste; chloride-paraffin, molykote lacquer, high pressure oil, corrosion-resistant grease or dry coating; Metalform and Combiflon, etc.

## 7.5 Screw-in depths for blind holes

The figure below shows the recommended minimum screw-in depths for blind holes in combination with various property classes, related to the shear strength of the material in which the bolt is attached.

$M_{eff}$  = effective screw-in depth.  
d = nominal diameter

## 7.6 Ratio of shear strength to tensile strength

The table below is based on VDI 2230 (2003)

| Property class | 4.6  | 5.6  | 8.8  | 10.9 | 12.9 |
|----------------|------|------|------|------|------|
| $\tau_B / R_m$ | 0,70 | 0,70 | 0,65 | 0,62 | 0,60 |

## 7.7 Clamping length table for preloaded bolts HV according to EN 14399-4

Table below is based on EN14399-4:2005. EN 14399 replaces the obsolete standard for HV fasteners DIN 6914, 6915, 6916.

| d   | M12                                 |      | M16  |      | M20  |      | M22  |      | M24  |      | M27  |      | M30  |      | M36  |      |      |

## 7.8 Locking

Correctly designed bolted joints, if correctly assembled, will not come loose. However, it is not always possible to design a joint so that it can optimally resist all causes of loosening. Additional articles such as spring washers or serrated washers can compensate loss of preload or prevent loosening.

### 7.8.1 Loss of preload

Loss of preload occurs through:

- Loosening due to change of length resulting from relaxation (embedding) and creep.
- Spontaneous loosening as a result of relative movement between the contact faces of the joint from dynamic load or load components acting transversely to the axis of the bolt. The joint then appears to become free of friction due to the elimination of the self-locking effect.

### 7.8.2 Classification of locking systems

Because of the various causes of loss of preload, a distinction is made in:

*Securing against embedding & creep*: add elements to compensate for embedding and creep.

*Securing against loss*: add elements to ensure that the joint does not fall apart if the preload is lost.

*Securing against rotating loose*: add elements to prevent spontaneous loosening by blocking the internal loosening moment.

The overview below gives, in addition to the classification of the three main groups mentioned above, a sub classification dependent on the function of the locking system.

The mentioned examples are no guarantee for optimum effect, because many other parameters will have influence on the joint behaviour.

| Cause of loss of preload   | Classification of locking systems with respect to: |                                       | Examples  | Reference <sup>2)</sup>  |

For more specific information on this subject a brochure is available on request.

In order to determine the effectiveness of a certain locking system, use is often made of a generally accepted test, the "Junker machine". This machine subjects the products to dynamic transverse forces and graphically records the loss of preload, depending on the number of alternating loads. Fabory has the ability to perform these tests.

### 7.8.3 Some practical suggestions for an optimum bolted joint

- Applying a high preload will limit critical displacements on the contact faces significantly. (Take into account the surface pressure of the clamped material).
- Controlled tightening.
- The greatest possible clamping length/diameter ratio, preferably  $L_k / d > 5$ .
- Prevent displacement of construction elements by using e.g. dowels and clamping bushes, etc.
- Increase the friction between contact faces by applying friction coatings or by roughening the surface by blasting.
- Make the contact faces smooth and parallel.
- When there is only static axial load and the assembly is correct, there is no need for locking mechanisms.
- The improper use of embedment and retention systems is more likely to make the reliability of the joint worse than better. Do not use them for dynamic transverse loads.

*Note:*

Locking systems must be used under both the bolt head and the nut. A locking washer assembled on a flat washer is useless.

## 8 Tables

### 8.1 SI units

In the following table a selection is given of those measuring units that are commonly used in fastening engineering.

| Name         | Symbol           | Unit of                       | Replaces   | Mutual conversion (rounded off)                             |  |
|--------------|------------------|-------------------------------|--|---|--|
| newton       | N                | force                         | kgf, kp  | 1N ≈ 0,1 kgf ≈ kp   | 1 kgf ≈ 1 kp ≈ 10N   |
| joule        | J                | energy, work, heat            | kcal, cal, kgf.m or kgm Btu (British thermal unit) | 1J ≈ 1Nm ≈ 0,1 kgf.m<br>1J = 0,739 cal                      | 1 kgf.m ≈ 10J ≈ 10Nm<br>1 cal = 4,187J                       |
| bar          | bar              | pressure of liquids and gases | at, kgf/cm <sup>2</sup> of kg/cm <sup>2</sup>      | 1 bar ≈ 1 at ≈ 1kgf/cm <sup>2</sup> ≈ kg/cm <sup>2</sup>    | 1 at = 1 bar   |

## 8.2 Conversion of tensile strength, Vickers, Brinell and Rockwell hardnesses

The table below is for information only and based on the withdrawn standard DIN 50150 (2000) and applies when the values are determined as follows:

- The tensile strength according to ISO 6892-1, Vickers hardness according to ISO 6507-1, Brinell hardness according to ISO 6506-1, the Rockwell hardness according to ISO 6508-1 and applies for unalloyed and low alloyed steels. Considerable deviations can usually be expected with high alloy and/ or cold-worked steels.
- In principle, every conversion of hardness results in a certain degree of inaccuracy and may only be used when a measuring method cannot be carried out. Conversion cannot lead to rejection, unless a certain measurement method has been agreed at the time of ordering.
- A conversion between tensile strength and hardness will result in an even greater deviation and therefore can only be used as an indicative value. This can never replace the tensile strength determined by tensile testing.

| Tensile strength<br>N/mm <sup>2</sup> | Vickers Hardness<br>HV10 | Brinell Hardness<br>HB | Rockwell Hardness |       |      |      |                   |       |       |       |
|---------------------------------------|--------------------------|------------------------|-------------------|-------|------|------|-------------------|-------|-------|-------|
|                                       |                          |                        | HRB               | HRF   | HRC  | HRA  | HRD <sup>1)</sup> | HR15N | HR30N | HR45N |
| 255                                   | 80                       | 76,0                   |                   |       |      |      |                   |       |       |       |
| 285                                   | 90                       | 85,5                   | 48,0              | 82,6  |      |      |                   |       |       |       |

1) Rockwell hardness HRD is not DIN standardized, but is provided for reference, because it is used internationally, e.g. in the American ASTM E18.

## 8.3 Contact and chemical corrosion tables

### 8.3.1 Contact corrosion table

| S = severe corrosion of the metal, shown in the row                                      |                       |                  |      |                             |                  |                |            |                   |            |                |      |     |        |                 |
|--|-----------------------|------------------|------|-----------------------------|------------------|----------------|------------|-------------------|------------|----------------|------|-----|--------|-----------------|
| G = no or limited corrosion of the metal, shown in the row                               |                       |                  |      |                             |                  |                |            |                   |            |                |      |     |        |                 |
| M = moderate corrosion (in an extremely damp atmosphere) of the metal, shown in the row. |                       |                  |      |                             |                  |                |            |                   |            |                |      |     |        |                 |

<sup>1)</sup> Relative relationship of this metal surface area with respect to the areas of the metals shown in the columns shown at the side.

#### Example:

**A zinc plated screw assembled on a large stainless steel construction: the relatively small zinc surface will tend to corrode quickly (S); the stainless steel will not corrode (G)**

- A stainless steel screw assembled on a large zinc plated construction: the small stainless screw will not tend to corrode on the zinc plated construction (G), nor will the relatively large zinc surface corrode due to contact with the stainless steel (G).

### 8.3.2 Chemical corrosion table
